About cKinetics

cKinetics is a mission driven Sustainability Insight, Innovation & Capital Advisory Firm. We work with businesses, investors, industry groups as well as thought leaders to continually generate market insight and catalyze change. cKinetics leverages thought processes for accelerating sustainable business and investing practices that include: (a) Closed loop systems, (b) Decentralized production and consumption, and (c) Resource conservation.

About Climate Policy Initiative (CPI)

With deep expertise in finance and policy, CPI is an analysis and advisory organization that works to improve the most important energy and land use practices around the world. Our mission is to help governments, businesses, and financial institutions drive economic growth while addressing climate change. CPI has six offices around the world in Brazil, India, Indonesia, Kenya, the United Kingdom, and the United States.

About Shakti Sustainable Energy Foundation

Shakti Sustainable Energy Foundation works to strengthen the energy security of India by aiding the design and implementation of policies that support renewable energy, energy efficiency and sustainable transport solutions.

About Swiss Agency for Development and Cooperation

The Swiss Agency for Development and Cooperation (SDC) is an international cooperation agency within the Swiss Federal Department of Foreign Affairs (FDFA). In operating with other federal offices concerned, SDC is responsible for the overall coordination of Swiss development activities and cooperation, as well as for the humanitarian aid delivered by the Swiss Confederation.

Acknowledgements

The team acknowledges the valuable contributions from the Expert Committee and expresses its deep appreciation for their valuable inputs and guidance in formulating the taxonomy. In addition, the guidance received from Mr. R R Rashmi (Distinguished Fellow, Earth Science and Climate Change, TERI), Ms. Rajasree Ray (Economic Adviser, Department of Economic Affairs, Ministry of Finance) and Ms. Anita Marangoly George (Executive Vice-President Growth Markets, CDPQ India) was immensely helpful in steering this research piece towards requisite outcomes.

The team is thankful to Shakti Sustainable Energy Foundation for supporting this research effort. This report is a part of Shakti's ongoing Clean Energy Policy project, which is being supported by the Swiss Agency for Development and Cooperation (SDC). The team also expresses its appreciation for all the support and inputs received from the different policy institutions, regulatory bodies, lenders, investors, think tanks, development funds and rating agencies who were engaged during the course of this study.

Foreword

India's transition towards low carbon economic development requires mobilization of capital at scale. There is a need for structural transformation of financial policy and regulations to help direct capital towards green economic activities.

This report has taken the first step in defining "green" in context of India's Nationally Determined Contribution (NDC) commitment and economic goals. A formal definition of green finance relevant to India will set the agenda for progress in the next few decades and help foster an environment of transparency, sharing and commitment to green goals.

The evolving global investor dialogue is a signal that there is a clear intent to make the change. These investors are not only the flagbearers of this journey but also an ally for public institutions and policy bodies mandated to enable India's NDC goals.

I congratulate cKinetics and CPI for this effort in bringing to fore a subject of immense strategic relevance; more so, as Indian leadership initiates the implementation efforts in support of India 2030 vision as enshrined in our NDC. I further hope that this initial step is taken further along through necessary engagement with policy makers to ensure its adoption by various agencies thus reiterating India's commitment and desire to emerge as a global climate champion.

Atul Bagai

Head, UN Environment Country Office, India

Glossary

-	
Asset	An asset refers to any resource, property or item which has a financial or economic value
Blended Finance	Is the strategic use of development finance for the mobilization of additional finance towards sustainable development in developing countries (OECD)
Capital flow	Net investments made in a given specified period of time within a defined boundary such as a project, a firm, a country, or a fund
Carbon Capture & Storage (CCS) Carbon Capture and Utilization (CCU)	It is a carbon abatement process, which captures and deposits carbon dioxide from point sources in the form of an underground geological formation. It is the process of capturing carbon dioxide and utilizing it for business processes including manufacturing of fuels, polymers, carbonates and chemicals.
Clean coal technology	Technologies designed to reduce negative environmental impacts associated with coal-based power generation
Climate adaptation	Focuses on building resilience to risks emerging from the climate change
Climate mitigation	Focuses on addressing the climate change impact through avoidance and reduction of greenhouse gas emissions
Credit rating agencies	Ratings which evaluate the credit worthiness of companies or their ability to repay investors
Development Finance Institutions	Financial institutions which provide financial services to the underserved markets
E&S risks	Financial risks for the investors due to environmental and social risks related to the operations of the investee company/ project
Equities	Shares in a company granting ownership to an individual or an institution entitling them a portion in profits
ESG investing	Integration of Environmental, Social and Governance parameters in stock selection process in addition to financial parameters
Green Bonds Green Climate Fund (GCF)	A bond specifically earmarked for use in climate and environmental projects A global fund created to support the efforts of developing countries to respond to the challenge of climate change by reducing their greenhouse gas (GHG) emissions and adapting to climate change
Greenhouse gas (GHG)	Atmospheric gases (including carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and water vapor) that contribute to the greenhouse effect by absorbing infrared radiation from the sun
Insurance Regulatory and Development Authority (IRDA)	Insurance regulatory authority in India
Lifecycle (cradle-to-grave)	Assessment of the environmental impact associated with all the stages of a product's life starting from raw material extraction to the end of useful life
Pension Fund Regulatory and Development Authority (PFRDA)	Pension regulator of India
Reserve Bank of India (RBI)	Central bank of India controlling the issuance and supply of the Indian rupee
Renewable Energy Service Company (RESCO) model	RESCO invests, installs, operates and maintains a project and executes a power purchase agreement (PPA) for supply of electricity. The power generated is sold to customer for a fixed monthly charge.
Securities and Exchange Board of India (SEBI)	Regulator for the securities market in India
Statutory Liquidity Reserves	Proportion of deposits required to be maintained by the commercial banks in addition to the cash reserve ratio
Stock Exchange	A platform where financial securities can be bought or sold
Sustainable investing	It covers a broader set of investment universe with the aim to build an inclusive, economically, socially, and environmentally sustainable world

THE IMPERATIVE

Shaping a Green Finance ecosystem in India

Climate change will impact all sectors – directly or indirectly

Risks to stability also represents opportunities to match growth aspirations with environmental objectives

At least 40% of Bank loans and Capital market exposures are at risk from direct and knock-on effect of climate impact

Total Green Investment needed until 2030

Annualized US\$ 160billion

Policy and regulatory interventions are needed to drive market-wide green transition

Balancing NDC and growth goals

Principles of a Green Finance Taxonomy

- Promoting green transformation across all sectors and activities
- Green outcomes measured through climate positive results of an output
- Aligning financial sector to national environmental objectives

What are the drivers for a green transition?

Lenders

Investors

- Investment opportunities in large sectors (energy, transport) undergoing massive transition owing to environmental issues
- Reduced desirability of holding carbon-based assets for longer terms
- Government efforts into diversifying energy needs from sustainable sources
- Demand for disclosures on environmental and social risks

What are the challenges to green finance uptake?

- Perceived concerns due to insufficient evidence on viability and returns potential of green sectors
- Lack of unified standards, institutional guidance and frameworks risks
- Need for capacity building for environment risk analysis and developing sustainable finance practices
- Insufficient pool of green sector securities and stocks

Solutions to scale up green finance

Green finance roadmap and green tagging of investment and financing activities

Climate risk assessment guidance and disclosure mandates

Collaborating with international institutions and global climate catalysts to help direct flows into green instruments

Risk coverage through credit guarantees and other specialized products

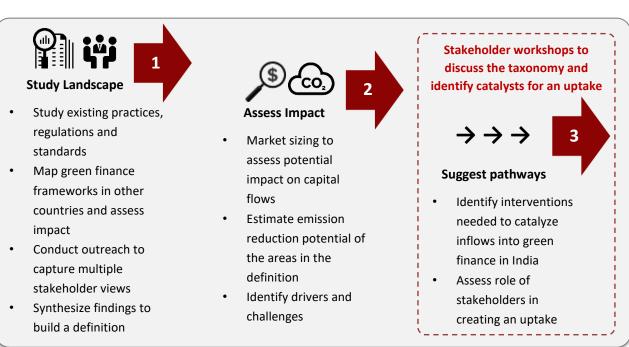

Approach and Methodology

This study analyses existing approaches and dimensions as adopted by different countries and institutions to defining green finance. Pursuant to a review of the existing characterization adopted by different governments, bi-laterals & multi-laterals institutions, catalysts, etc. and the outlook expressed by stakeholders¹ in the Indian landscape, a **definition of green finance** as deemed relevant to the Indian context has been evolved.

At an overarching level, the study considers that India's NDCs provide a practical background of economic objectives that any green finance taxonomy should align with. Thus, the taxonomy has been designed so that it responds to the NDC objectives and further contributes to other environmental objectives that are critical to green sustenance in the long-term.

A definition thus arrived was presented to stakeholders wherein the nature, relevance and applicability of the definition and possible catalysts for operationalizing the definition were also discussed. A sizing of the **investment potential** across 'green' sectors identified under the taxonomy and their **emission mitigation potential** (where sufficient basis was available for an estimation²) was also undertaken. Finally, the study offers a set of efficient **policy, regulatory and market interventions required** to catalyze the various segments along with efficient pathways to drive capital flows into green sectors.

Figure 1: Approach and methodology

¹ Refer Annexure 1 for list of stakeholders engaged during the study

² Given of some of the green areas are cross-cutting in nature (across industries), for instance, clean energy or difficult to fully quantify such as biodiversity, investment and emission mitigation potential has been estimated on best efforts and the final figures thus arrived represent the minimum (and not the maximum) investment requirement and emission mitigation realization expected through 2030.

EXECUTIVE SUMMARY

1. Executive Summary

Economic development has historically been measured in financial terms – gross domestic product (GDP) being the most prominent one. As societies have continued to evolve and their economic and financial systems have reached greater heights, a realization has slowly emerged— that costs associated with economic development do not account for the quantum of environmental debt and resource depletion incurred in the process. The conventional GDP metric does not provide a basis to measure and assess environment sustainability in the long-term. For enabling this holistic approach, a comprehensive definition of 'what constitutes Green' becomes crucial – this will not only help differentiate activities based on their environmental footprint and consequent long-term costs but also help highlight solutions that allow economies to grow sustainably.

This is particularly pertinent at this time for India as the country crafts out pathways to meet its Nationally Determined Contributions (NDC) goals. Per the targets set, India needs additional capital of US\$ 1.8trillion, amounting to an average of ~US\$ 160billion annually, in order to achieve only its adaptation and mitigation targets by 2030. To underline the scale of financing required, it is worth noting that India's GDP stood at US\$ 2.6trillion for 2017³. In stark comparison, the climate financing in India in 2016 was only around US\$ 14.4billion (with more than three-fourths of this being directed towards renewable energy).

Thus, there is an urgent need to drive large sums of capital from private and public sources into climate positive or 'green sectors'. Thus, a clear definition or a framework is foreseen as a core need to help engage and coalesce coordinated action.

In the Indian context, framing a definition for "green" requires a nuanced approach that not only looks at seemingly cleaner methods /infrastructure as compared to conventional ones but also provides for transition methods /interventions to modify existing practices into low carbon ones in the medium-term timeframe.

Defining green in context of India

This study aims to lay the foundation for defining "green" in the Indian context through a green finance taxonomy. It further probes the impact of such a taxonomy on the various sectors through a quantitative assessment of the expected investments to achieve emissions reductions targeted in each of these sectors through 2030 in India's Nationally Determined Contributions (NDCs).

The study observed that 'green' initiatives are typically perceived as being equivalent to 'climate'-related undertakings through conflation of the terms 'Green Finance' and 'Climate Finance'. Climate finance is currently a more prominent concept on the global stage driven by the political climate negotiations. However, UN Environment Programme (UNEP) and other initiatives recognize that imperatives of growth for different countries necessitate investment in areas beyond what is covered in climate finance and mitigation. The UNEP Inquiry adopts a simple approach: climate finance is a subset of green finance, which itself is a subset of sustainable finance. As such, green finance accrues benefits that go beyond climate change and its measurement of carbon emissions in the form of reduction in air, water and soil pollution, sustainable biodiversity, and similar green objectives that cannot be compartmentalized and measured in terms of greenhouse gas (GHG) emissions alone.

-

³ According to International Monetary Fund's World Economic Outlook (WEO) for April 2018

A universally accepted definition of green finance is not available yet, although several initiatives are ongoing across countries as also led by many international organizations. Given that the green priorities vary across countries, the efforts to define green finance are not necessarily aligned with each other even as the focus is on common end-goals.

In a developing economy like India with its diverse and often competing economic and environmental goals, a definition instituted by government, regulator or any authoritative agency would provide crucial conceptual clarity. More significantly, it could help align market participants, especially in the financial sector (like banks, domestic and foreign investors, stock exchanges) to the longer-term agenda of financing growth in an inclusive and sustainable way.

Approach to a green taxonomy

Climate change is an undiversifiable risk to financial stability that can affect portfolio performances through their exposure to heavy carbon emitting and polluting sectors. An important aspect informing this study is the recognition of climate change as a real and urgent threat by investors and asset holders, creating an urgent need to identify and quantify portfolio risks, redesign processes and reallocate portfolios. Investors need the right set of tools to respond to these risks and adopt a harmonized approach that carries green finance into the next decade for India in a coordinated manner.

Starts with a clear definition to "green" that is forward looking to a low-carbon future while allowing transition to green

Requires participation from all key actors in the financial system

Requires participation from all key actors in the financial system

Envisages a system that is green-aligned through the economic lifecycle of each activity— from manufacturing to operation to services

Figure 2: Coordinated approach to green finance

For an unbiased assessment, it is important to consider the existing drivers and recognize challenges at the domestic level, and compare those with other countries that are on a journey similar to ours.

Domestic considerations

Table 1: Key actors in the success of a green finance uptake

CURRENT FOCUS

CHALLENGES TO GREEN FINANCE UPTAKE

- - o To deliver on long-term low carbon vision, government launched a number of efforts in areas such as Clean and efficient energy, Smart Cities, Green Buildings, Make in India, Urban Mobility, etc.
 - o Pricing fossil fuel consumption through coal cess and incentivizing through PAT schemes, Feed-in-tariffs and renewable certificates
- Sensitized banking sector about international initiatives like Equator principles (2007), accorded priority for banks to provide loans with a threshold of INR 150million to specific borrowers in renewable energy sector (2015)
- SEBI issued green bond issuance guidelines (Total Issuance of INR 6billion by 2017); mandatory business responsibility reporting for top 500 listed entities to mainstream sustainability reporting although current format doesn't add value to carbon emission disclosure practices
- Limited focus on climate change risk
- Follow E&S risk assessment although mostly for compliance reasons
- Banks play a key role in providing long-term financing at competitive rates. However, Basel III compliance requiring larger capital requirements (compliance deadline March 2019 for Indian banks) and existing pressures on loan books (12.1% gross non-performing assets as of 2018) limit banks' ability (and in turn willingness) to deploy funds in emerging sectors where risk is perceived to be higher
- Institutional investors, that have access to longterm funds, do not consider climate change risk in their investment decision making
- Current models do not recognize climate risks
- No premium placed when assessing project, activity or green associated in environmentally-friendly sectors. No additional risk attached to conventional investments that are not aligning to 1.5° scenario
- Green Climate Fund (GCF) accredited direct access entities)
- NABARD has an Environment and Social policy that covers 36 eligible activities under agriculture and related sector, social sector and rural connectivity

- To deliver on NDCs while balancing inclusive growth **GOVERNMENT** No formal tracking of budget allocations to assess if flows are sufficient to meet NDC targets
 - Inadequate guidance at policy level to drive capital flows into climate-friendly projects
 - Existing efforts mostly focused on RE (solar and wind) and not being replicated "at a similar scale" across other sectors like sustainable transport, green building

- **REGULATORS** Environmental risks yet to be recognized as a 'major' threat to financial stability
 - Climate change risk assessment not part of insurance and pension fund investment guidelines. Regulatory provisions heavily rely on rating agencies to identify high-rated investments, limiting scope for support to climate-friendly projects

BANKS

- No specific focus on lending to environment-friendly sectors; focus limited to RE based on priority sector lending rules
- Insufficient clarity on what constitutes green finance and no guidance to enable clear differentiation between green from non-green sectors
- Do not consider climate risk in lending practices

CAPITAL MARKET **PLAYERS**

- Insurance, pension, and mutual funds not focused on green financing
- Limited sectoral knowledge and assessment tools to categorize and assess environmentally-friendly
- Have the capacity but no guidance to create uptake
- **RATING AGENCIES**
- Not integrating climate change risk into rating models and do not have enough framework or motivation to undertake this without regulatory guidance and investor demand
- **FINANCIAL**

(DFI)

- Have access to climate finance (NABARD, SIDBI are DEVELOPMENT Focus may be skewed or limited to selected sectors like agriculture
 - **INSTITUTIONS** No mandate to focus on sectors like clean energy, waste and pollution control, water management, transportation
 - Limited technical expertise, skills and knowledge to undertake a broader approach in green

International perspectives

India shares some of the same challenges as its international counterparts; local solutions can therefore draw on their approaches and relevant experiences.

Figure 3: Green finance motivations and experiences in other countries

Country-level drivers/challenges that inspired green initiatives

- NDC commitments, economic challenges of growth and equity, potential climate change impacts
- Energy security dependency on fossil fuels
- Balancing environmental sustainability with economic growth aspirations

Goals & Investment needs

- Arresting environmental degradation, promoting resource efficiency and building resilience through low-carbon transition
- Climate-smart investment holds significant potential in major developing nations. IFC
 estimates indicate this as: China (US\$ 14.9trillion), Vietnam (US\$ 753billion), South Africa
 (US\$ 588billion), Indonesia (US\$ 274billion) and Bangladesh (US\$ 138billion). Investment
 in Green buildings is expected to be a key driver.

Approaches to mainstream green finance

- Integrating green elements into national planning strategies
- Green banking policies/guidelines a dominant route in integrating "green" into financial sector
- Green definition based on a sectoral approach for most comparable peers. Vietnam and China further defined "green" at an activity level
- Environment receiving most focus in the definitions although coverage goes beyond climate change to include other environmental objectives

Unique levers to the approach

- Directed lending to Green sectors through banking channels
- Banks recognizing E&S risks in credit assessments
- Sectoral guidelines, although varying in levels of granularity, introduced to guide lending into green sectors
- Lower risk weightage to green sectors
- Innovative ways to promote green: China's green finance pilot zones, EU's financial product labelling standards

Stakeholder view

Coordination amongst key actors and alignment of their actions to longer-term national objectives can enable greater green finance uptake in India. Stakeholders engaged over the course of this study highlighted the need for an India-focused taxonomy to be shaped by a set of guiding principles. However, as guiding principles can be broad in scope, most practitioners added that a sectoral view is needed to identify and differentiate economic activities across different sectors to ensure appropriate prioritization of capital flows.

Figure 4: Stakeholder view

Stakeholder speak: Current Practices

- •Focus on sustainable and inclusive growth
- Measure impact based on end-results
- •Not just limited to "green"
- Providing longterm assistance to viable projects
- Already witnessed success with Renewable lending portfolio (low stress vs. conventional power loans)
- Allocate a positive score on account of renewables vs. other infrastructure

- •E&S compliance for project financing
- Do not track emissions from lending to sectors (conventional or nonconventional)
- Understand relevance of green but don't consider it as a criteria that drives investing decisions
- •Regulation disallows investment in securities with ratings lower than AA
- Financial viability of projects precedes green or climatefriendliness (extractives priced at a premium)
- Uncertainty about longterm performance of renewables
- ESG looked at from a compliance lens only

Stakeholder speak: what does (uptake of) green finance need?

- Vision-led approach
- Clear guidelines for different stakeholders
- Broad definition
- Give green contributors recognition or financial benefits
- •Offer a place in the Priority sector list (like RE)
 - Policy push with regulatory guidance
 - Provide viability gap funding
 - Offer subsidies, tax rebate, import component subsidies, GST (lower bracket)
- Recognize green lending as priority
- Incentivise to create uptake
- •Top-Down process where government intervention is needed although implementation needs to be gradual
- Incentives to encourage fund managers to prioritize the capital allocation into specific green
- Regulatory guidance to ensure climaterelated risks are factored into asset rating at all levels

categories

Sensitization of rating agencies

- Uptake in capital markets unlikely unless it fulfils a specific market need that can be served
- Will need to be a market-led approach; currently there is no demand to incoporate these dimensions

Principles and criteria considered under the green finance taxonomy

Learning from international experiences on approaches undertaken for development of green finance taxonomies, direct engagement with stakeholders active on the India realm⁴, and inputs from leading experts⁵, the following set of principles have guided the development of a proposed India-specific Green Finance taxonomy:

- 1. Promotion of activities that align to broader environmental sustainability goals these cover protection and conservation of natural resources, clean and efficient use of energy, waste reduction, pollution control and sustainable biodiversity management
- 2. Alignment to an outcome-linked approach that measures *net contributions* over the lifetime of a project. An outcome is considered green if:
 - a. The output creates climate positive results
 - b. It can indicate a demonstrable and measurable change from the base case⁶
- 3. Alignment of financial sector to national environmental objectives to govern the flow of resources towards climate positive outcome-aligned sectors

In addition to the guiding principles, which are broad in scope, stakeholders also forwarded the idea that a sectoral view identifying 'green' economic activities across different industries and segments be provided for illustrative purposes. A summary representation of the sector coverage under the taxonomy is presented in Figure 5.

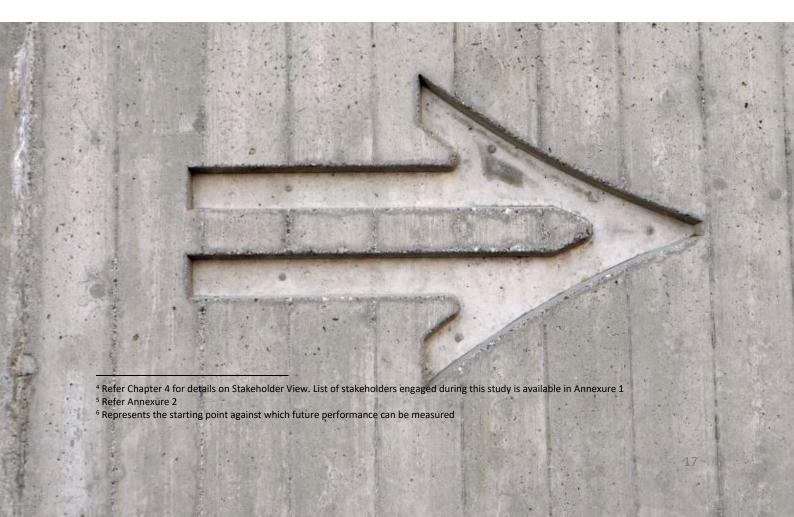

Figure 5: Green finance taxonomy - sectoral summary

Clean Energy	Energy Efficiency	Clean Transportation	Green Buildings	Sustainable Agriculture and Land Use	Waste & Pollution Control	Water Use & Conservation	Climate Adaptation
Wind	Process efficiency	Vehicles	New buildings	Ecological Protection	Waste water treatment	Water Conservation	Disaster monitoring, warning and emergency response system
Solar	Bulk energy services	Key components	Renovation, upgrade and modernization of existing building stock	\$ 51 S	Sludge in waste water	Rural drinking water safety	Flood mitigation
Small hydro	Product		Alternative construction materials	Forestry Development	Air pollution	Urban water conservation	Hygiene emergency
Tidal	Process/ Technology			No-till farming	Municipal Solid Waste (MSW)	Water conservation	Epidemic disaster
Geothermal		•		Organic agriculture	Soil pollution	Waste water methane	Forest protection
Biomass energy				Integrated pest control (IPM)	Tailings and Associated Mine	Waste water – sludge used as fertilizer	Drought management
Nuclear				Precision farming	Industrial Solid Wastes, Exhaust Gas, and Effluent	Inputs manufacturing	Public health management
Smart grids				Animal husbandry and Fishery	Renewable energy waste resource	Supply chain	Food security
Green energy corridors				Agro-forestry	Electromechanical Products	Raw materials manufacturing	Manufacturing devices
EV charging infrastructure				Conservation and management of wet lands	Co-generation		Raw materials manufacturing
Transport Infrastructure				Farming equipment and pesticide	Environmentally sustainable products		Storage and distribution
Facilities				Raw materials	Resource-efficient packaging and distribution		R&D
Clean coal technologies				Storage and Distribution	Manufacturing devices and equipment		Disaster monitoring, warning and emergency response IT system
Renovation & Modernization (R&M) of thermal power technologies				IT Development and Services	Raw materials manufacturing		
Generation equipment					Storage and Distribution		
R&D for RE equipment, EE products					R&D		
Renewable energy (solar) appliances & products Systems and equipment for Delivery Asset Energy Storage							

Legend	

Assets	Projects/processes/activities that are already low carbon or enable low carbon performance
Implementation	Practices/techniques/solutions that are considered green due to their impact on the environment
Practices	
Manufacturing &	Creation of products/activities that are deployed into green projects/processes
R&D	

Investing in green transitions

An overview of investment needs across different sectors indicated in the taxonomy is presented below.

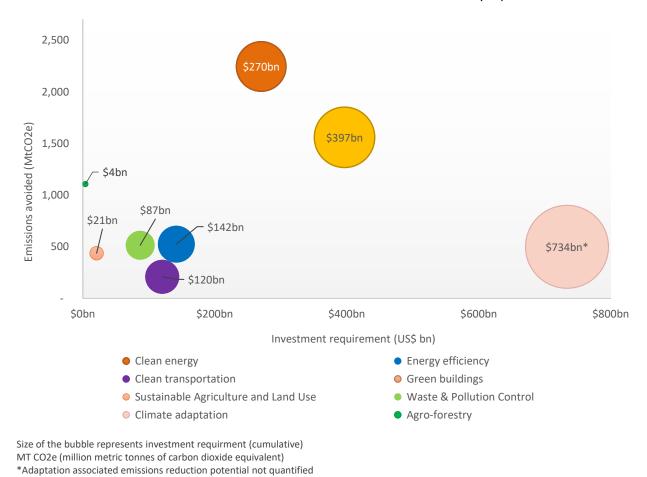

Figure 6: Investment needs and emission reduction potential across major sectors, 2020-2030

Model estimates indicate that clean energy will be a powerful source to facilitate large-scale carbon emission reduction. That being said, new investments occurring or expected to occur in sectors like buildings, automobiles, industries, agriculture will need better alignment with environmental objectives. For instance, investment in buildings will continue given the demand from housing sector but environmental sustainability measures need to be ensured so that the unbuilt stock is conceptualized to be energy efficient from the start. Investments in biodiversity, agro-forestry and climate adaptation will help increase India's carbon sink. A bigger socio-economic issue requiring greater importance is the amount of waste and pollution (air, soil, water) the country generates which needs urgent attention because of the high amounts of particulate matter pollution.

A wave of change is already underway with the increase in government's "green-aligned" policies in energy, transportation and agriculture sectors. Other sectors need to catch onto this wave of change similarly.

The views expressed by stakeholders and experiences of other international markets unequivocally point to the fact that interventions that can help evolve a transformative green finance environment will need to include both public policy and institutional approaches, as presented below.

Figure 7: Policy and regulatory interventions to catalyze green finance at scale

Policy action

Macro approaches to increase green finance availability and allocation in the economy.

Earmarking a portion of Statutory Liquidity Reserves (SLR) from commercial banks for green investments through issuance of green government securities — Green SLR

Creating a dedicated green financial institution /bank which develops capacity and knowledge to access green and climate finance sources

Using a small part of Forex reserves to leverage and crowd in additional climate finance flows from international institutional investors by creating financial vehicles outside India

Regulatory action

Risk assessment guidance and disclosure mandates to enable reforms

RBI: Stronger risk assessment frameworks that recognize and measure green and non-green exposures of banks (green tagging), credit quota (under priority sector lending), green lending as a collateral for refinancing from RBI

Pension and Insurance Funds: Minimum capital allocation to green projects, making climate

green projects, making climate change risk assessment of portfolio a fiduciary responsibility

SEBI: Mandatory disclosure of carbon emission and risk disclosure of listed companies, promotion of green equities and bonds, adjusting green premium to valuation of companies in the IPO stage

Market action

Markets need to be more responsive to institutional needs, esp. from international investors

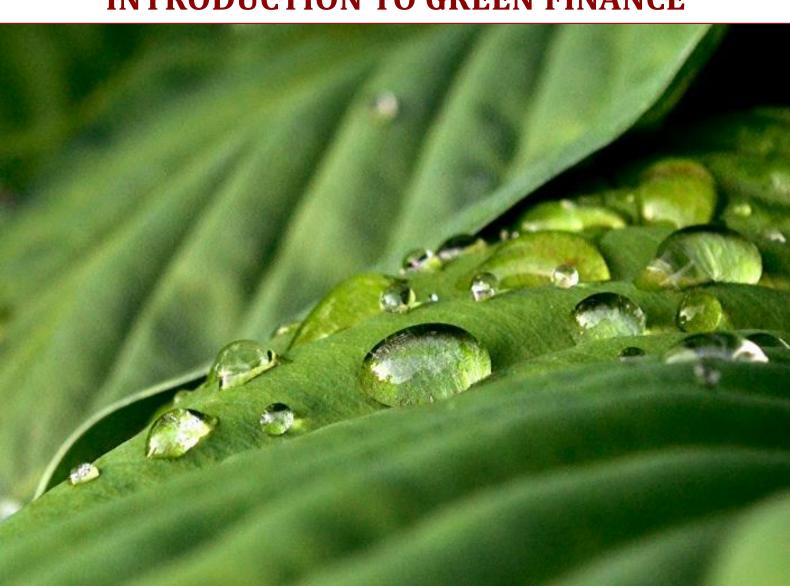

Stock exchange: Promote listing of green equities and green bonds through incentives (lower listing fee), creation of dedicated green indices, lower brokerage fee for green investors

Mutual funds: Issue risk guidance materials for investors (especially retail investors) that highlight climate exposure risks, work with regulator to explore climate risk grading of funds

Credit rating agencies: Mandatory incorporation of climate change risks into rating models, realign credit ratings approach to promote green ratings

Growth of nations will increasingly get defined and measured by their ability to balance economic growth and environmental considerations. Many developing and developed nations are making significant strides, challenging the economic and financial status quo, and upgrading themselves with eco-friendly and environmentally-aware institutions and processes. India needs to undertake similar bold steps that are strategic to its growth in the next few decades. While creating a green finance taxonomy is only a first step to this longer-term endeavor, it is a significant one that can ensure "growth" and "green" are emphasized in parallel to foster in a modern era of "green growth".

INTRODUCTION TO GREEN FINANCE

2. Introduction to Green Finance: Setting the Context

Sustainable development requires a coordinated approach that aligns environment, social, and economic objectives duly supported by a strong governance structure. However, framing an alignment across these objectives has been a key challenge.

While economic objectives are relatively well understood and have been clearly defined in quantitative terms, environmental and social objectives, even though deeply enshrined in all economic activities, have been less adequately defined, measured and reported. To address this, countries have come to agree and measure the impacts on environmental degradation through the lens of climate change which, simply stated, is "a change in the usual weather found in a place"⁷.

The Paris Agreement, regarded as one of the most critical international set of guidelines towards fighting climate change, adopted a bottom-up approach asking 189 countries to submit their own commitments, thereby setting countries on a path to a low-carbon future. However, for the low carbon/green growth to be mainstreamed, a comprehensive quantifiable approach is needed. This study aims to bring forth exactly that through the lens of green finance by highlighting how "green" needs to be ensconced within economic objectives.

Green finance has been reflected upon in a number of ways although **no internationally agreed definition exists currently**. Quite often, Sustainable Finance, Green finance, and Climate Finance are used interchangeably and therefore misunderstood. Moreover, there are other terms such as ESG investments and responsible investments which are sometimes used as substitutes for green finance by various stakeholders.

As a first step, this study focuses on defining what is "green" in the context of Green finance. This builds off the approaches/frameworks formulated by different agencies and countries, a few of which are discussed below.

UN Environment Programme (UNEP) Inquiry

UNEP Inquiry presents the interplay of different terminologies taking a simple approach: Climate finance is a subset of Green finance, which itself is a subset of Sustainable finance, as represented in Figure 8⁸.

 $^{^7\,}https://www.nasa.gov/audience/forstudents/k-4/stories/nasa-knows/what-is-climate-change-k4.html$

 $^{^8\,}http://unepinquiry.org/wp-content/uploads/2016/09/1_Definitions_and_Concepts.pdf$

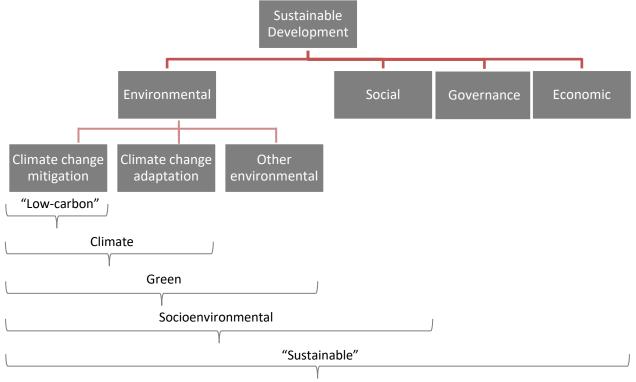

Figure 8: Differentiating climate finance and green finance

Source: UNEP Inquiry

Sustainable Finance covers a broader set of investments with the aim to build an inclusive, economically, socially, and environmentally sustainable world.

Green finance includes climate finance but also includes other environmental objectives necessary to support sustainability, particularly aspects such as biodiversity and resource conservation.

Climate finance refers to "local, national or transnational financing—drawn from public, private and alternative sources of financing— that seeks to support mitigation and adaptation actions that will address climate change."9

⁹ https://unfccc.int/topics/climate-finance/the-big-picture/introduction-to-climate-finance

Some of the existing definitions of green finance include:

G20 Green Finance Study Group

Green finance can be understood as the "financing of investments that provide environmental benefits in the broader context of environmentally sustainable development. These environmental benefits include, for example, reductions in air, water and land pollution, reductions in greenhouse gas (GHG) emissions, improved energy efficiency while utilizing existing natural resources, as well as mitigation of and adaptation to climate change and their co-benefits." ¹⁰

Deutsches Institut für Entwicklungspolitik (German Development Institute)

Green finance comprises:

- 1. the financing of public and private green investments¹ (including preparatory and capital costs) in the following areas
 - environmental goods and services (such as water management or protection of biodiversity and landscapes)
 - prevention, minimization and compensation of damages to the environment and to the climate (such as energy efficiency or dams)
- 2. the financing of public policies (including operational costs) that encourage the implementation of environmental and environmental-damage mitigation or adaptation projects and initiatives (for example feed-in-tariffs for renewable energies)
- 3. components of the financial system that deal specifically with green investments, such as the Green Climate Fund or financial instruments for green investments (e.g. green bonds and structured green funds), including their specific legal, economic and institutional framework conditions.¹¹

The need for India to have a focused green finance definition comes from its unique standing in the transition towards low-carbon based development. India's transition requires a taxonomy that creates a path for growth into green sectors while also allowing for retrofits or energy efficiency measures to take place in existing sectors. An India specific green finance taxonomy will allow the country to customize its own transition by factoring in variables that are peculiar to India.

It has been noted that there are challenges in tracking the entire gambit of activities entailed in green growth or even climate finance as only flows that are directly related to assets/ activities enabling reduction of emissions are considered, and any indirect flows that result in emissions reduction are ignored to avoid double counting. As an illustrative example, investment into the deployment of a wind farm is counted, but finance related to technology R&D, manufacturing of farm equipment, revenue support provided to the wind farm owners, future refinancing or future sale of such an asset are not considered.¹²

Clearly, if growth and environmental sustainability need to be pursued as an integrated 'green' agenda in India, there needs to be an approach that fosters growth by standardizing practices, recognizing all market participants, providing policy and regulatory framework to incentivize action and enhancing transparency through regular reporting. A conceptual framework synthesizing the green finance ecosystem is presented below.

¹⁰ http://unepinquiry.org/wp-content/uploads/2016/09/Synthesis_Report_Full_EN.pdf

¹¹ https://www.cbd.int/financial/gcf/definition-greenfinance.pdf

¹² https://climatepolicyinitiative.org/wp-content/uploads/2018/11/Global-Climate-Finance-An-Updated-View-2018.pdf

Figure 9: Conceptual representation of green finance ecosystem

A combination of public, private and alternative sources funding will need to be raised to fill the investment gap. The need to catalyze broader financial sector participation creates the need for a structured (if not holistic) definition of green finance.

Without a clear definition, attribution is likely to be subjective and may actually trigger dissonance if actions are deemed not in sync (like greenwashing¹³). Also, environmental compliance of norms does not always lead to a climate positive action. For instance, a captive coal-based power plant being setup by a textile manufacturer at its facilities as per environmental norms may not be considered as climate-friendly as it does not contribute to carbon reduction. A clear definitional framework would ensure that components of green finance including components supporting aspects related to climate risk mitigation and adaptation are accurately accounted for and that capital flows are encouraged towards these areas to ensure progress on all objectives.

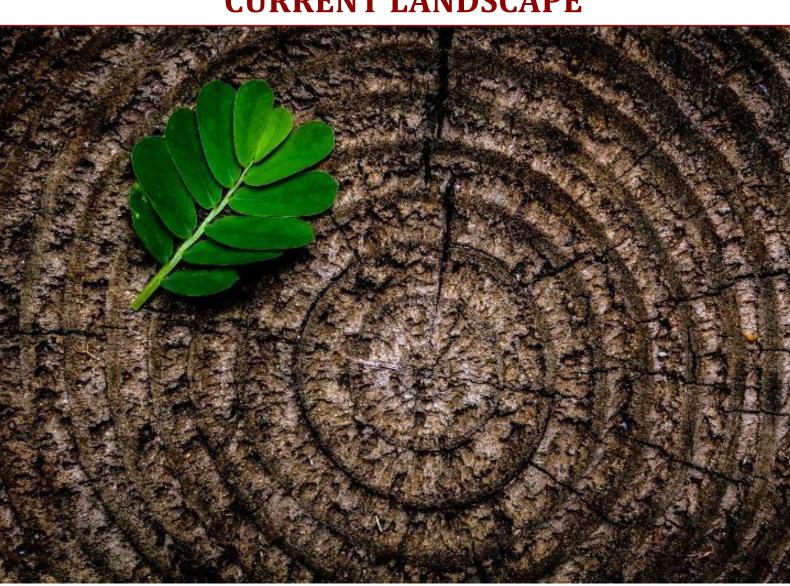

Green finance can play an important role in addressing the investment gap by catalyzing private participation, provided there is a clear definition, framework and mechanism to support new capital inflows

-

 $^{^{13}}$ Incorrect classification of unsuitable products or projects or flows as environmentally sustainable

CURRENT LANDSCAPE

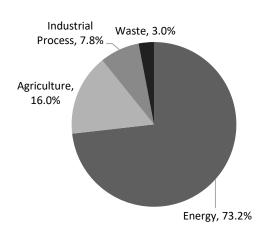

3. Current Landscape

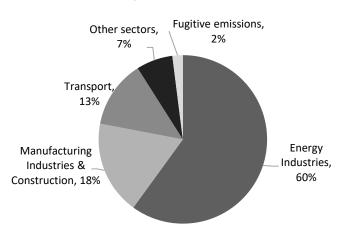

India's NDC target of reduction of emission intensity of its GDP over 33%-35% by 2030 from 2005 levels revolve around seven areas: renewable energy, energy efficiency, carbon efficient and resilient cities, waste management, clean transportation, pollution control, and afforestation¹⁴. The focus on these areas reflects from the sector-wise emissions distribution, especially from the energy sector.

Figure 10: Status of GHG emissions

Distribution of GHG emissions by sector, 2014

Distribution of emissions across Energy Sector Categories, 2014

Source: India Second Biennial Update Report to the United Nations Framework Convention on Climate Change

India is likely to witness an increase in emissions due to its continuing development needs across energy, industry, transport and infrastructure sectors. Despite low per capita emissions (1.95 tonnes CO_2^{15} compared to world average of 4.2 tonnes CO_2 emissions¹⁶), India represents 7.1% of the total global greenhouse gas emissions¹⁷, which has seen an average growth rate of 6% over the past decade.¹⁸

Like many of its comparable peers, adopting a low carbon pathway has been made a part of India's national strategy since committing to the Cancun pledge in 2010 to reduce emissions intensity of GDP 20-25% by 2020 (against 2005 levels) and then the 2015 Paris commitment (as expressed in NDC) to reduce emissions intensity 33–35% by 2030 (against 2005 levels). In addition, under the 2015 NDC, India aims to achieve about 40% cumulative electric power installed capacity from non-fossil fuel-based energy sources and create a carbon sink of 2.5 to 3 billion tonnes of CO_2 equivalent through additional forest and tree cover by $2030.^{19}$

 $^{^{19} \} https://www4.unfccc.int/sites/ndcstaging/PublishedDocuments/India\%20First/INDIA\%20INDC\%20TO\%20UNFCCC.pdf$

The government has undertaken various measures to achieve the NDCs, some of which are indicated below.

Table 2: Key measures to achieve the NDCs

Category	Key targets, policies and schemes			
Renewable Energy	 Adoption of 175 GW Renewable energy by 2022. Increase share of cumulative electric power installed capacity from non-fossil fuel-based sources to 40% by 2030. 			
	 National Wind-Solar Hybrid Policy: Promotion of large grid connected wind- solar PV hybrid system 			
	National Smart Grid Mission: To accelerate Smart Grid deployment			
	 Green Energy Corridor scheme: Development of infrastructure for evacuation & integration of the renewable energy capacity 			
Green Buildings	 Energy Conservation Building Code: To establish minimum energy performance standards for buildings 			
Transportation Electric Vehicles Municipal Solid Waste	 National Electric Mobility Mission Plan: Aimed at achieving electric/hybrid vehicle sales of about 6-7 million by 2020 in addition to a certain level of indigenization of technology²⁰ Faster Adoption and Manufacturing of Hybrid & Electric Vehicles (FAME) Scheme: Launched under NEMMP, the scheme aims to support the market development and manufacturing ecosystem for hybrid/electric vehicles in India Charging Infrastructure for Electric Vehicles- Guidelines and Standards: To support creation of EV charging infrastructure²¹ Swachh Bharat Mission: Aims to improve cleanliness through improved Solid and Liquid Waste Management activities and achieve Open Defecation Free 			
Climate-Smart Urban Water	(ODF) India National Water Mission: To ensure integrated water resource management			
Climate-Smart Agriculture	 Pradhan Mantri Krishi Sinchayee Yojana: To enhance water use efficiency in irrigation Rashtriya Krishi Vikas Yojana: To ensure development of agriculture and allied 			
	sectors National Food Security Mission: To increase annual production of rice, wheat, pulses and coarse cereals			

India needs additional capital of US\$ 1.8trillion, amounting to annual investments of US\$ 160billion, in order to achieve adaptation and mitigation targets by 2030 (based on a sectoral/sub-sectoral investment model detailed out further along in this report). The above measures highlight government's commitment to achieve the NDCs but, given the size of investment required, there is support needed from multiple actors.

In order to coalesce action from these actors, India needs to adopt a standardized approach. In the following section, the current focus of key actors in the Indian financial ecosystem and the challenges limiting the uptake of green finance amongst them is discussed.

²⁰ https://dhi.nic.in/UserView/index?mid=1347

Drivers of the financial ecosystem

Table 2: You geters in the success of a green finance untake						
Table 3: Key actors in the success of a green finance uptake						
 CURRENT FOCUS To deliver on NDCs while balancing inclusive growth To deliver on long-term low carbon vision, government launched a number of efforts in areas such as Clean and efficient energy, Smart Cities, Green Buildings, Make in India, Urban Mobility, etc. Pricing fossil fuel consumption through coal cess and incentivizing through PAT schemes, Feed-in-tariffs and renewable energy certificates 	GOVERNMENT	 CHALLENGES TO GREEN FINANCE UPTAKE No formal tracking of budget allocations to assess if flows are sufficient to meet NDC targets Inadequate guidance at policy level to drive capital flows into climate-friendly projects Existing efforts mostly focused on RE (solar and wind) and not being replicated "at a similar scale" across other sectors like sustainable transport, green building 				
 Sensitized banking sector about international initiatives like Equator principles (2007), accorded priority for banks to provide loans with a threshold of INR 150million to specific borrowers in renewable energy sector (2015) SEBI issued green bond issuance guidelines (Total Issuance of INR 6billion by 2017); mandatory business responsibility reporting for top 500 listed entities to mainstream sustainability reporting although current format doesn't add value to carbon emission disclosure practices Limited focus on climate change risk 	REGULATORS	 Environmental risks yet to be recognized as a 'major' threat to financial stability Climate change risk assessment not part of insurance and pension fund investment guidelines. Regulatory provisions heavily rely on rating agencies to identify high-rated investments, limiting scope for support to climate-friendly projects 				
 Follow E&S risk assessment although mostly for compliance reasons Banks play a key role in providing long-term financing at competitive rates. However, Basel III compliance requiring larger capital requirements (compliance deadline March 2019 for Indian banks) and existing pressures on loan books (12.1% gross non-performing assets as of 2018) limit banks' ability (and in turn willingness) to deploy funds in emerging sectors where risk is perceived to be higher 	BANKS	 No specific focus on lending to environment-friendly sectors; focus limited to RE based on priority sector lending rules Insufficient clarity on what constitutes green finance and no guidance to enable clear differentiation between green from non-green sectors Do not consider climate risk in lending practices 				
 Institutional investors, that have access to long- term funds, do not consider climate change risk in their investment decision making 	CAPITAL MARKET PLAYERS	 Insurance, pension, and mutual funds not focused on green financing Limited sectoral knowledge and assessment tools to categorize and assess environmentally-friendly sectors Have the capacity but no guidance to create uptake 				
 Current models do not recognize climate risks No premium placed when assessing project, activity or green associated in environmentally-friendly sectors. No additional risk attached to conventional investments that are not aligning to 1.5° scenario 	RATING AGENCIES	 Not integrating climate change risk into rating models and do not have enough framework or motivation to undertake this without regulatory guidance and investor demand 				
Have access to climate finance (NABARD, SIDBI	DEVELOPMENT	• Focus may be skewed or limited to selected				

are Green Climate Fund (GCF) accredited direct access entities) • NABARD has an Environment and Social policy that covers 36 eligible activities under

NABARD has an Environment and Social policy that covers 36 eligible activities under agriculture and related sector, social sector and rural connectivity

DEVELOPMENT FINANCIAL INSTITUTIONS

- Focus may be skewed or limited to selected sectors like agriculture
- No mandate to focus on sectors like clean energy, waste and pollution control, water management, transportation
- Limited technical expertise, skills and knowledge to undertake a broader approach in green

Framing perspective from international experiences

A combination of developing countries and international economic groups like the European Union were studied to examine their approaches to framing definitions of green finance, associated policies, regulations and ensuing impact. As many have only recently started on their green growth journey, measurements at a performance level are preliminary and limited. Nonetheless, these still serve as relevant frameworks to map the extent of measures being undertaken by countries that are on a similar journey as India and face similar economic growth, climate change and climate investment challenges²².

Some of the drivers that seem to have influenced recognition of green finance in these economies, their approach to mainstream "green" and key unique levers that facilitated the approach are summarized below. A detailed mapping of the various actions undertaken by key peer countries is discussed in Annexure 4 and Annexure 5.

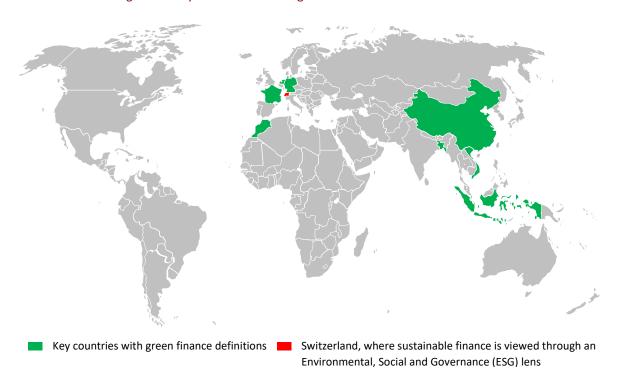

Figure 11: Key countries where a green finance definition has been created

Major countries, together representing 28% of the global population, have adopted a green finance definition including China, Vietnam, Bangladesh, Indonesia, France, Germany, Netherlands. There are encouraging signals coming from Europe where a detailed taxonomy (67 activities across 8 sectors) of environmentally sustainable economic activities has been proposed along with a number of other measures in the areas of climate-related benchmarks and disclosures and disclosure requirements in related to Environmental, Social and Governance (ESG) factors. Once implemented, these measures are collectively expected to create a significant impact on the direction of investment flows in one of the leading developed regions of the world.

Interestingly in Switzerland, sustainable finance covers any form of financial service that integrates ESG criteria into business or investment decisions.

²² To ensure the analysis factored in the Indian context, the peer group was identified based on the methodology discussed in Annexure 3.

Figure 12: Green finance progress observed in comparable countries

	Bangladesh	Vietnam	China	Indonesia	EU
Approach to mainstream green finance	 Green Banking Guidelines issued by the central bank Key green finance categories include renewable energy, energy efficiency, solid and liquid waste management, recycling and recyclable products Mandatory Environmental & Social Risk Management for Banks and FIs 	Central bank issued Catalogue to define green sectors: renewable energy, energy saving and energy efficiency, land use conversion and management, sustainable forestry, sustainable waste management, and green agriculture Capital markets regulator driving company sustainability reporting	 Green finance definition with multiple levels—sectors, subsectors and activity Categories include: energy saving, pollution prevention and control, resource conservation and recycling, clean transportation, clean energy, ecological protection and climate change adaptation 	 Green finance covered in the "Indonesian Roadmap for Sustainable Finance 2015-2019" Definition covers climate change mitigation, resource efficiency, protection and natural capital and biodiversity, climate change adaption Policy on green bond issuance to invite private participation and provide clear guidance 	Sustainable taxonomy proposed in 2018, rollout in 2020-22 Taxonomy defines environmentally sustainable activities in these areas: mitigation, adaptation, water protection, waste recycling, pollution and healthy ecosystems Develop labelling standards for financial products and prospectus for green bonds in 2019

²⁹ Notes on the Green Credit Statistics Information Disclosure, CBRC

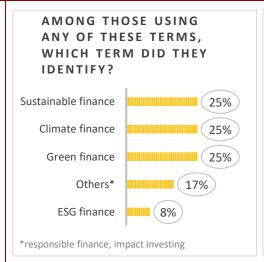

In addition to mapping the international action on green finance, the study engaged with financial institutions, policy makers and regulators, think tanks and credit rating agencies to frame a holistic 360° view on green finance.

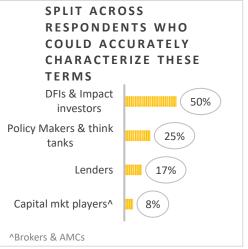

Defining green finance: Stakeholder view

The study entailed a detailed mapping of key stakeholders and their perspectives on the different dimensions of 'Green Finance'. A schematic overview of the current state, stakeholder perceptions, and outlook is summarized below.

Clarity / Usage of terminologies at the organizational level

Key takeaways

- A majority of stakeholders could not clearly identify or associate any internal initiatives /use of a term that connotes Sustainable, Climate, Green or ESG finance within their organizations.
- Amongst the ones who could clearly identify one of the said terms mostly DFIs, impact investors, and policy makers - sustainable, climate and green finance were reportedly equally known.

Stakeholder speak: Current Practices

- •Focus on sustainable and inclusive growth
- Measure impact based on end-results
- •Not just limited to "green"
- Providing longterm assistance to viable projects
- Already witnessed success with Renewable lending portfolio (low stress vs. conventional
- Allocate a positive score on account of renewables vs. other

infrastructure

- E&S compliance for project financing
- Do not track emissions from lending to sectors (conventional or nonconventional)
- Understand relevance of green but don't consider it as a criteria that drives investing decisions
- Regulation disallows investment in securities with ratings lower than AA
- •Financial viability of projects precedes green or climate-friendliness (extractives priced at a

premium)

- Uncertainty about longterm performance of renewables
- •ESG looked at from a compliance lens only

Stakeholder speak: what does (uptake of) green finance need?

- Vision-led approach
- Clear guidelines for different stakeholders
- Broad definition
- Give green contributors recognition or financial benefits
- Offer a place in the Priority sector list (like RE)
- Policy push with regulatory guidance
- Provide viability gap funding
- Offer subsidies, tax rebate, import component subsidies, GST (lower bracket)
- Recognize green lending as priority
- •Incentivise to create uptake
- •Top-Down process where government intervention is needed although implementation needs to

be gradual

encourage fund managers to prioritize the capital allocation into specific green

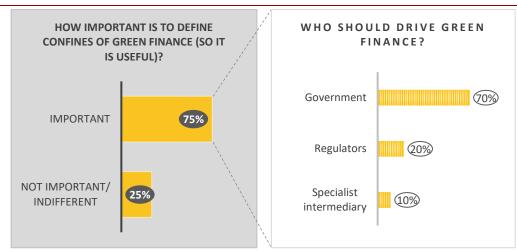

Incentives to

- categories
 •Regulatory
 guidance to
 ensure climaterelated risks
 are factored
 into asset
 rating at all
- Sensitization of rating agencies

levels

- •Uptake in capital markets unlikely unless it fulfils a specific market need that can be served
- •Will need to be a market-led approach; currently there is no demand to incoporate these dimensions

Institutionalization

Key takeaways

- Most practitioners aware of the importance of a definition. Banks, regulators, DFIs, think tanks, foundations view formulating a definition an "important milestone" if there is serious thought to drive the market
- Rating agencies and capital market players do not consider green finance important.
- o No demand from market for Rating agencies to consider climate proactiveness in credit ratings
- Difficult for insurers to model impact of climate risk in their investing

Stakeholder speak: defining green

- Industrial (biggest polluters)
- Energy (go beyond renewables)
- Urban Transportation
- Pollution prevention and control
- Water conservation services
- Infrastructure
- Climate finance is green
- Infrastructure lending is green
- Renewable energy financing in any form is green (even when lending to conventional sector)
- Loans & bonds are green
- Government budget expenditure
- Carbon Capture & Storage (CCS)
- Manufacturing as an activity is not green, e.g., EV manufacturing, storage device manufacturing (like batteries)
- Target sectors for green

 Financing modes

 Colour & Context of Green

 What is not green

 Grey areas
- Green (low carbon) technologies
- Product alignment to 1.5° or 2° scenario
- Low carbon transport
- Wastewater related technologies
- Climate resilient Buildings
- Carbon capture and utilization (CCU) in industrial applications is green
- Energy efficiency and energy saving facility is green
- Urban mass transit (metro) is considered green
- EV charging stations are green
- Clean coal (technologies) is green as it reduces emissions
- Clean coal as a product is not green
- Biofuels are a point of contention in terms of greenness
- Coal plant even if reduces emissions is not green
- Energy efficiency upgrades of thermal power plants

*Similar topics across multiple categories colour-coded

Understanding climate risk exposures

Climate change is a systemic risk to financial stability that can affect portfolio performances with exposures to heavy carbon emitting and polluting sectors. An important aspect informing this study is the recognition of climate change as a real and urgent threat by investors and asset holders, creating an urgent need to identify and quantify portfolio risks, redesign processes and reallocate portfolios.

Compared to short/medium term investors, there appears to be a larger risk of impact on long term investors (like insurance companies and pension funds) since the liability duration of these investors and the realization of climate risks are long-term. For instance, an increase in the frequency of natural disasters (floods, storms) will result in higher insurance claims. It is a cause of concern for insurance companies whose liabilities are intricately linked to asset values in sectors such as agriculture (crops) and infrastructure (buildings, roads, highways, ports). India's cumulative losses from weather events are estimated at US\$ 45billion (2008-17), having doubled from US\$ 20billion in the previous decade³⁰.

Indian government and regulatory institutions need to work with the financial sector to come up with a plan to stress-test the entire financial sector's exposure to (a) physical risks that are event-driven (floods, cyclones) or longer-term shifts in climate patterns; and (b) transition risks stemming from policy actions, legal, technology and market changes. This will be a starting point for climate risk assessment and reporting and also provide direction for new products and systems to enhance system's resilience to climate shocks.

Globally, a divestment wave is driving investors to remove high carbon emitting sectors such as mining, oil & gas, coal-based power generation from their portfolios owing to their physical and transition risks³¹. The financial performance of these and many other associated/dependent sectors is likely to erode further as litigation, reputational and regulatory risks drive investor action.

-----First impact and high-at-risk Knock-on effect for Sectors that act as Climate heavy users of energy or 'carbon sinks' dependent industries Bank credit at risk Physical risk Agriculture & allied Mining & quarrying Transportation 2 activities \$1.2 Regulatory risk Power generation & utilities Steel & metals Forestry Resource-based (cotton, leather, Chemicals & chemical Reputation risk wood, paper, rubber, plastic) products bank Oil & gas Cement & construction Competition risk Water systems Engineering, Industries, Manufacturing Agriculture & allied activities Litigation risk Loans at risk \$273 bn Loans at risk \$209 bn Loans at risk \$164 bn Capital market exposures at risk Production risk Investments in banking & financial \$195 bn **Capital Market** services First impact and high-at-risk sectors \$72 bn Knock-on effect for heavy users of \$112 bn energy or dependent industries Source: RBI, NSDL

Figure 13: Climate risk exposure in the Indian financial sector

 $^{^{30}\,}https://www.action on climate.today/wp-content/uploads/2019/01/climate-losses-revised.pdf$

³¹ Transition risks are those arising from the transition to a low-carbon and climate-resilient economy

Given the sector-wide transitions likely to be underway, new investment opportunities are seen on the anvil. Thus, even as global markets are still coming to terms with the magnitude and nature of climate-associated risks, asset owners globally (including pension funds, sovereign wealth funds, foundations) are setting targets to increasingly gain exposure to investments into clean technologies, waste and water infrastructures.

It is worth noting that India, being one of the fastest growing economies globally, enjoys high level of interest as an investment destination from international institutions and Foreign Portfolio Investors (FPI), who have invested US\$ 420billion as FDI (April 2000-March 2019)³² and US\$ 480billion (March 2019)³³, respectively. There is also a high level of confidence from domestic financial sector participants including banks and long-term capital market investors that together hold over US\$ 2.5trillion in loans and investments³⁴. While all of this illustrates a reasonable flow of capital, there needs to be conscious effort to redirect this capital into green sectors and position India as an economy that attracts more international investments into green areas.

China presents an exemplary case where an entire green finance network has been created to bring in new capital into green sectors to meet US\$ 320billion (2015-2020 annual investment) target. The country currently reports that it has a sizeable green loan book of US\$ 1.37trillion³⁵, around US\$ 960billion invested into green and low-carbon projects (leveraging the public-private partnerships model)³⁶ and US\$ 289billion in green bonds (2018)³⁷.

A green finance taxonomy will create common ground that allows participants to view environmental data in context of national goals, empower investor decisions and align them to policy objectives and provide a framework to encourage companies and project developers to strengthen their green investing.

³² https://dipp.gov.in/sites/default/files/FDI_Factsheet_27May2019.pdf

³³ https://www.fpi.nsdl.co.in/web/Reports/ReportDetail.aspx?RepID=84

³⁴ As per latest figures available, Bank and NBFC credit outstanding stood at US\$ 1.25trillion (March 2019) and US\$ 254billion (FY2018), respectively; amount invested by domestic Mutual Funds, Pension Funds (EPFO, NPS) and Insurance companies was US\$ 346billion (March 2019), US\$ 175billion (March 2018) and US\$500 billion (March 2018), respectively.

INTRODUCING THE GREEN FINANCE TAXONOMY FOR INDIA

4. Introducing the Green Finance Taxonomy for India

Learning from international experiences, direct engagement with stakeholders active in the India realm, and inputs from the Expert Committee, the following set of principles have emerged to guide the development of a proposed India specific Green Finance taxonomy:

- 1. Promotion of activities that align to broader environmental sustainability goals these cover protection and conservation of natural resources, clean and efficient use of energy, waste reduction, pollution control and sustainable biodiversity management
- 2. Alignment to an outcome-linked approach that measures *net contributions* over the lifetime of a project. An outcome is considered green if:
 - a. The output creates climate positive results
 - b. It can indicate a demonstrable and measurable change from the base case³⁸
- 3. Alignment of financial sector to national environmental objectives to govern the flow of resources towards climate positive outcome-aligned sectors

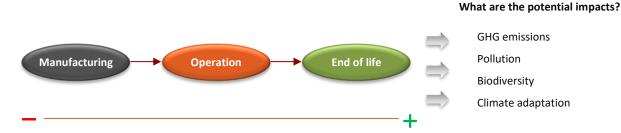

The taxonomy has been aligned with the NDC measures but it also recognizes additional, equally critical, environmental objectives like biodiversity conservation, pollution prevention, and water sanitation.

There are multiple frameworks by which one can define green finance: conceptual definition, principles-based, sectoral taxonomy, exclusionary criteria³⁹. Based on stakeholder and expert committee inputs, it was observed that a green finance taxonomy should focus on activities where outcomes generate a measurable impact or a demonstrable change from the current or the base case⁴⁰. As guiding principles can be broad in scope, stakeholders also forwarded the idea that a sectoral view that identifies economic activities across different sectors be provided for illustrative purposes. Therefore, a sectoral view has been created to list activities that occur in a value chain and provide dimensions by which their 'greenness' may be assessed.

Even as Greenness can be depicted through a "shades of green" approach⁴¹: dark green (already achieving low-carbon goals), medium green (facilitating significant reduction in emissions), and light green (some emission reduction in the short term), the stakeholders discussion indicated that such approach may incentivize /limit financing in favor of dark green (like renewable energy generation) vis-à-vis letting a more integrated view of green investments evolve and thus enable capital flow to retrofits and /or energy efficiency measures (which may be categorized as medium or light green).

The below graphic presents how contributions, moving through the lifecycle ("cradle-to-grave") of economic activities in an asset, can make it green at a net level. While individually, these pillars may not create potentially positive impacts (on emissions, pollution, biodiversity or adaptation), at an aggregate level they will help result in environmentally positive outcomes. Sectoral illustrations are provided in Table 4.

Figure 14: Lifecycle of sectoral activity

³⁸ Represents the starting point based on which future performance can be measured

⁴⁴ Ibid.

	Sub-category	Description	Scope	Green considerations	India relevance, targets, initiatives
					Energy potential estimated around 8000 MW ⁴⁵
	Geothermal	Utilizes heat stored in the earth's crust. Geothermal resources include dry steam, hot water, hot dry rock, magma, and ambient ground heat.	Construction and operation of the facility		Target 10,000 MW by 2030 ⁴⁶
	Biomass energy	Biomass energy is generated from the conversion of solid, liquid and gaseous products derived from biomass. It involves processing of biomass which includes any organic (biological) matter available on a renewable basis including wastes and residues from agriculture, forestry and related industries as also the organic waste from municipal and industrial sources.	Construction and operation of the facility	Lifecycle emissions Liquid biofuels for transport have been most heavily associated with the environmental and social criticisms of bioenergy. Traditional use of biomass in cooking needs to be avoided.	Biomass Target: 10GW installed capacity by 2022. Current installed capacity: 8.7GW (December 2018)
	Nuclear	Uses nuclear reactions to generate heat used to produce electricity. Nuclear is recognized as one of the lowest emitters of GHGs that can generate electricity. ⁴⁷	Construction and operation of the facility	Raw material storage, disposal of nuclear waste (toxicity), risk of accidents	Target: 13.5GW installed capacity by 2024 and 22.5GW by 2031. ⁴⁸ Current installed capacity: 6780 MW, i.e., 2% of current installed capacity (December 2018)
Delivery Asset	Smart grids	Smart grid components including Wireless/ Wired/ Optic Communications, smart power meters, smart substations, controls, sensors	Setting up of smart grid infrastructure (will support both conventional and renewable power).	Lifecycle assessment GHG emissions	Electricity transmission and distribution (T&D) system losses in India are among the highest in the world ⁴⁹ . As of 2014-15, these were reported to be 22.77%, that
	Green energy corridors	Dedicated infrastructure for evacuation of renewable energy from generation points to the load centres through strong grid connections	Setting up transmission and distribution network		is over twice the world average and nearly three times the levels in the US. ⁵⁰

⁵⁰ https://beeindia.gov.in/sites/default/files/Transmission%20and%20Distribution%20Losses%20by%20CEA.pdf

	Sub-category	Description	Scope	Green considerations	India relevance, targets, initiatives
	EV charging infrastructure	Setting up and operation of EV charging stations and energy supply facilities for battery charged vehicles	Construction and operation of the facility		Available of electric charging infrastructure will be critical to uptake of EVs in the country.
	Transport Infrastructure	Construction of new roads, bridges, infrastructure upgrades, railway lines for freight and passenger traffic	Infrastructure construction companies, contracting companies setting up the projects		This area is already making a big impact in metros and has found mentions from Niti Aayog as a potential option to promote shared mobility.
	Facilities	Examples include district cooling and heating facilities that may be used for commercial or residential buildings	Set-up and operator of the facility		
Implementation Practices	Clean coal technologies	Technologies like Pulverized Combustion Ultra Super Critical (PC USC), Pressurised Circulating Fluidised Bed Combustion, Super Critical, Combine Cycle (PCFBC SC CC), Integrated Gasifier Combined Cycle (IGCC), Solid Oxide Fuel Cell (SOFC), Integrated Gasifier Fuel Cell (IGFC), Underground Coal gasification (UCG). These technologies were recognized in India's NDCs as possible options to make existing thermal power plants cleaner.	Investment in Ultra supercritical and Supercritical technologies that are high- efficiency, low-emission (HELE)		Low efficiency levels at existing coal plants (28% average efficiency compared to 36% in China and 33% in the US) resulting from subpar quality of coal available in the country (that carries low energy content meaning more coal needs to be burnt to achieve same level of electricity) and subcritical technologies employed in coal-fired plants (that are low-cost but use more coal) have had the government consider measures to control coal-related GHG emissions through the employment of clean coal technologies. ⁵¹
	Renovation & Modernization (R&M) of thermal power technologies		Renovation, modernisation and Life Extension of old coal power stations		Energy efficiency targets set for 144 old thermal stations (as per NDC). R&M of existing old power plants requires less investment (vis a vis. setting up a new plant), can be completed in a shorter time frame and can help reduce emissions through adoption of upgraded technologies. ⁵²

	Sub-category	Description	Scope	Green considerations	India relevance, targets, initiatives
R&D	Generation equipment	Generation equipment including but not limited to: •wind: wind power monitoring system, control, systems of wind farms •solar PV: PV modules (panels), inverters, mounting structures, trackers, batteries and charge controller •small hydro: hydraulic machinery, steel structures, turbines, generator unit •tidal: turbine, generator, steel or floating structures •geothermal: geothermal vents, steam generator, condenser, turbine	Construction and operation of the facility	Lifecycle assessment GHG emissions Ensuring that the products are manufactured sustainably (compliance with BEE standards) Addressing environmental and social considerations	Indian government, in alignment with the 'Make in India' campaign, is encouraging locally manufactured products by prescribing that solar power projects bidding in RE sector projects need to source a majority of the components/ products locally
	R&D for RE equipment, EE products	R&D for creation of new and improved RE products and technologies. Examples of R&D projects include: •new product development: design and development of organic solar cell sub-modules which can be potentially low-cost, light-weight usable in tents, congested city environments (where modules need to be folded or rolled and kept away when not in use). ⁵³ •cost efficient solutions: develop efficient single phase system to convert solar energy to electrical energy from solar PV. ⁵⁴	Capital expenditures to RE dedicated projects		R&D in manufacturing needs to be recognized as a critical building block for a wider scale-up for renewable energy (target of 175 GW through renewable energy by 2022) and energy efficiency in India
	Renewable energy (solar) appliances & products	Includes solar lighting systems like lantern, solar street lighting and heating systems like solar cookers	Construction and operation of the facility		
	Systems and equipment for Delivery Asset	Key components	Construction and operation of the facility

INVESTING INTO GREEN TRANSITIONS

5. Investing in Green Transitions: Sizing the Investment Requirement Key green sectors: Investment opportunity and GHG reduction potential (2020-30)

A step-by-step mapping of key green sectors and sub-sectors was undertaken to estimate the investment requirement. Given that some of the sectors/sub-sectors identified as green are cross-cutting in nature (e.g., clean energy or difficult to fully quantify sectors such as biodiversity), investment and emission mitigation potential has been estimated and the final figures thus arrived at are conservative and represent the minimum investment requirement and emission mitigation realization expected through 2030.

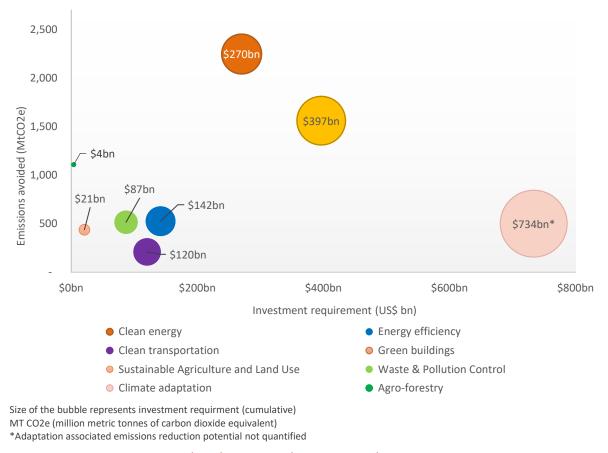

Figure 15: Investment needs and emission reduction potential across major sectors, 2020-2030

It is estimated that public investment sources will contribute 25% of the total mitigation related investment gap (US\$ 1.04trillion) through 2030. However, this capital will primarily serve as a catalyst to attract greater private participation. For instance, public funding in ventures to de-risk private capital, spending to support adaptation initiatives, or rolling out demand and supply side incentives in emerging industries that enable green sectors to gain scale in operations.

There is an urgent need to develop an integrated approach to green financing to mobilize the required amount of capital to meet India's NDC goals.

Beyond renewables, investments that can be identified as green are under-recognized and only marginally explored in other major sectors. These are the sectors heavily impacted from climate change in value terms and likely to undergo a transformation through 2030. A bottom-up analysis as part of this study confirms market estimates⁶⁷ that renewable energy attracts US\$ 10-15billion annually, although there is limited data to tag green investments in other sectors. This is not to say that all investment (beyond renewable energy) cannot be green or environmentally friendly, but given the lack of regulatory requirement or market pressure to color investments (green vs. brown), it is difficult to accurately gauge current levels of green investment.

Across the eight sectors identified within the taxonomy, a breakdown of investment requirements was undertaken, which further established the point that while clean energy is benefitting from a massive public sector push and private sector opportunity, the risk and investment requirements in other sectors continues to rise.

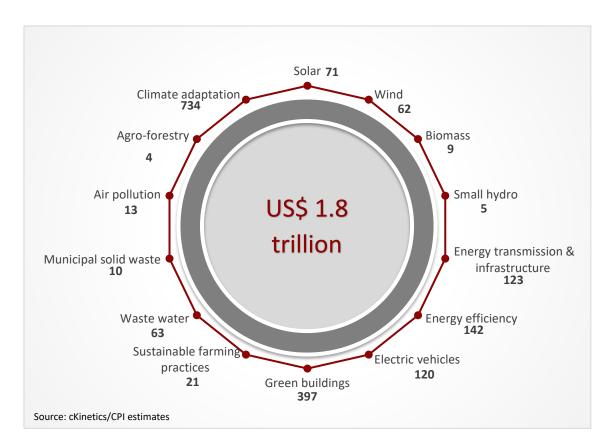

Figure 16: Detailed breakdown of cumulative investment requirements at the sub-sector level

⁶⁷ CPI, BNEF

A sectoral analysis of key sectors/sub-sectors of the taxonomy was undertaken to identify the drivers, barriers, business models, and possible financing mechanisms to create a full realization of the climate mitigation and adaptation potential. A summary of this analysis is presented below.

Table 5: Key drivers, challenges and characteristics of key green sectors

Clean Energy

Key drivers

- Renewables undermine coal competitiveness. Coal is facing headwinds from its own rising costs and the broader economic shift favouring renewable growth. Levelized cost of energy (LCOE) is expected to continue to move in favour of renewables⁶⁸
- Long-term risks of stranded assets⁶⁹ will likely drive down coal investments further. A change in the investment trajectory can be seen already investment into renewables now exceeds coal. (The past two-year average investment into renewables stood at US\$ 19billion vs. US\$ 8billion in coal⁷⁰)
- Private sector participation has been key in capacity expansion and mobilizing capital from banks, bonds (green) and private equity sources instead of relying in foreign capital. In fact, FDI flow into non-conventional has not kept pace with sector growth⁷¹. This has also brought a 'power' shift in sector traditionally majority held by central and state governments (that owns two-thirds of the conventional capacity)
- Vast market potential for India that has an estimated RE potential of 1,096 GW comprising 750 GW in solar power, 302 GW in wind, 25 GW in bio-energy and 21 GW in small hydro⁷². Less than 10% of this potential has translated into capacities

Challenges

- Lower returns and heightened risks for developers. Government auctions have been a preferred method for adding new RE capacities. The overcompetitive bidding process has resulted in low margins for developers as also overexposed them to risk of a sudden change in business conditions (e.g., rise in equipment costs)
- Evacuation and grid integration. On-demand availability of power requires timely evacuation, grid integration and avoidance of curtailment⁷³. India has made progress by setting up green energy corridors (GEC) to evacuate RE, but such projects need to run ahead of new capacity additions. Currently, the GEC is underfunded⁷⁴
- Slow demand uptake from residential sector. In solar rooftop, 70% of the installed capacity comes from commercial and industrial (C&I) customers⁷⁵ who find this solution attractive due to better cost economics of solar vs. grid power⁷⁶ as also accelerated depreciation benefits. In comparison, less than 20% solar rooftop demand has come from domestic (residential) consumers due to low/subsidized electricity tariffs, lack of consumer awareness and high upfront costs
- Policy uncertainty and payment delays from electricity distribution utilities (DISCOM) weaken sector confidence, reduce
 pace of installations and create viability challenges for small developers

- High upfront costs require financing support in initial years
- Medium to long-term investment horizon depending on type of project
- Steady, long-term margins possible due to low recurring capital expenditure and operating costs
- Significant amount of financing for renewable power projects has originated from SBI, IREDA, L&T Finance and IDFC⁷⁷.
 Dependency on banks and NBFC carries risks as financial sector is overwhelmed with non-performing assets (NPAs)

⁶⁸ https://www.teriin.org/sites/default/files/2018-12/Coal-Transition-in-India.pdf

⁶⁹ The International Energy Agency defines stranded assets as "investments which have already been made but which, at some time prior to the end of their economic life (as assumed at the investment decision point), are no longer able to earn an economic return as a result of changes in the market and regulatory environment brought about by climate policy".

⁷⁰ https://www.iea.org/wei2019/

⁷¹ FDI into non-conventional energy at US\$ 4.8 billion in last 5 years.

⁷² http://pib.nic.in/newsite/PrintRelease.aspx?relid=174832

⁷³ Curtailment is a reduction in the output of a generator from what it could otherwise produce given available resources, typically on an involuntary basis.

⁷⁴ http://164.100.47.193/lsscommittee/Energy/16_Energy_39.pdf

⁷⁵ Commercial includes shops and offices, and Industrial includes manufacturing units

⁷⁶ According to Bridge to India, C&I consumers account for more than 50% of India's total power demand and make savings of up to 50% through rooftop solar systems as their grid tariffs are typically between INR 7-10 (US¢ 11-16)/ kWh

⁷⁷ https://www.cenfa.org/wp-content/uploads/2018/06/2017-COAL-vs-RENEWABLE-Report.pdf

Renewable Energy Service Company (RESCO) model could give a boost to solar rooftop installations in the residential
sector by reducing the initial cost burden provided consumers awareness is raised, RESCOs are ensured of recoveries (in
case of defaults) and power purchase agreements are adhered to and maintained

Energy Efficiency (EE)

Key drivers

- **Primary energy demand will continue to increase** (541 million tonnes of oil equivalent (Mtoe) in FY2017 to 877 Mtoe in FY2031⁷⁸). Industrial sector consumes maximum power (57.7% share). Currently accounting for only ~9% share each, energy demand from residential and commercial⁷⁹ and transport is expected to become fairly significant (2.2x and 5.6x increase, respectively) in FY2031
- Government-owned Energy Efficiency Services Limited (EESL) has been a key driver for the EE market through its large-scale market transformation programs like pan-India transition to LED street lights, mass procurement of LED bulbs, replacing agricultural pumps with energy efficient technologies, rolling out smart meters⁸⁰ and, more recently, releasing tenders to set up Electric vehicle (EV) charging stations
- For industries, PAT has given rise to demand for energy efficiency solutions like pollution equipment, created a market
 mechanism to trade energy savings and overall created obligation and incentive for industries to invest and save. Further
 efforts to make PAT compliance a norm across industries (expanding scope to cover 80% of top emitting sectors) will help
 drive industry investments

Challenges

- Some of the **key issues for the sector** include lack of awareness about EE solutions and energy performance contracting, limited ESCO credibility, limited technical assessment capability of Financial institutions (FIs) in evaluating EE projects, and the involvement of new, innovative (and unestablished with higher perceived risk) technologies
- Limited access to internal funds and borrowing capacity make it difficult for SMEs to invest in EE, while small project size and development costs make financing transaction costs higher for the SMEs. High initial investment and lack of financial incentives deters implementation even when lifetime costs of EE solutions turn out to be lower
- **EE appliances await a wider EE transformation.** While EESL has successfully created a thriving market for LEDs through mass procurement programs, there are bigger challenges in the form of residential and commercial cooling (refrigeration and air conditioning) that need to be addressed in a cost-efficient manner. For instance, currently a 5-star AC is priced around INR 8,000-10,000 higher than a 3-star AC. Given that consumer purchase decisions are influenced by purchase prices (especially for high ticket purchases), it impacts the choice for EE products

Business characteristics and financing mechanisms

- High initial investment cost needs for EE solution implementation. Industrial projects seeking energy efficiency can be capital intensive, for instance, waste heat recovery projects can take investments costs of up to INR 16crore (US\$ 2.25million) per MW⁸¹. Similarly, energy efficient appliances with higher energy ratings are not yet cost competitive enough to become first choice of consumers
- Creating dedicating financial commitments for banks to lend a minimum amount towards EE projects of MSMEs
- Market needs to move beyond traditional instruments like dedicated credit lines (soft loans) with risk sharing facilities and
 into creation of sector-specific instruments that can help build scale like green instruments, insurance products to
 protect ESCOs in the event of non-realization of projected EE savings
- Greater push needed for banks to invest in capacity building initiatives that create/build skillset and in-house employee expertise in assessing industry-specific EE requirements

Clean Transportation

Key drivers

• Electric vehicles (EV) present a significant investment opportunity for automobile manufacturing sector. The Indian automobile industry, sized at US\$ 93billion, contributes 7.1% of the total GDP (FY15-16)82. It is one of the top destinations attracting Foreign direct investment (FDI) with cumulative inflows of US\$ 21.4billion (during April 2000-March 2019)83

 $^{^{78}\} https://www.beeindia.gov.in/sites/default/files/press_releases/UNNATEE\%20Report.pdf$

⁷⁹ Energy usage from lighting and appliances, HVAC heating, ventilation and air conditioning (HVAC) and energy demand in cooking

⁸⁰ It is a type of electricity meter that communicates directly with the electricity distribution utilities (DISCOM) and provides users with an accurate analysis of their energy usage

⁸¹ http://ietd.iipnetwork.org/content/waste-heat-recovery-power-generation

⁸² Automotive Sector Achievements Report, Department of Heavy Industries

⁸³ https://dipp.gov.in/sites/default/files/FDI_Factsheet_27May2019.pdf

- Linkage with energy sector, personal mobility needs, and emission targets serve as key drivers to move towards clean and shared mobility solutions. To put it in perspective, there is a stronghold base of automotive industry that witnesses demand in excess of 26 million vehicles (FY18-19)
- Two-wheelers dominate the market with 84% share in total automobile sales (FY18-19) followed by 13% in passenger vehicles and 3% in three-wheelers. According to Niti Aayog, two- and three- wheeler segments are the most market-ready to transition to EVs⁸⁴
- Case for transition to EVs becomes stronger with the potential savings in terms of fuel (70% of diesel, 99.6% of petrol consumed by transport sector⁸⁵), reduction in air pollution and the expected growth in demand for vehicles in a sector which accounts for 11% of India's carbon emissions⁸⁶
- Government tightening of norms and suggested move to completely transition two and three wheelers to electric

Challenges

- Lack of adequate charging infrastructure reduces purchase confidence in a vehicle that is currently more expensive than conventional ones. Other countries already ahead in their transition have a strong charging infrastructure base 70,000 charging stations (2.6 million EVs) in China and 24,000 stations (1.1 million EVs) in the US⁸⁷. There are some 222 charging stations in India⁸⁸
- Lack of capabilities to support battery manufacturing locally, reliance on imports for key raw materials (lithium, nickel, cobalt, graphite) alongside no technological capabilities in producing lithium batteries
- · Limited grid capacity and overall infrastructure readiness to handle a massive ramp up in EVs

Business characteristics and financing mechanisms

- Vehicle loans from bank and NBFCs are the dominant route for financing. For the lending institution, it is considered as personal lending or retail financing
- Setting up a local manufacturing base for EVs is expensive and requires greater policy push. Clarity in government policy
 on long-term transition is needed to provide confidence to automobile manufacturers to set up (or modify) their
 manufacturing facilities. Lack of a clear policy, for instance, the future of subsidies and conditions set up under FAME 2 is
 making it difficult for large manufacturers to commit to long-term transition plans that require substantial capital
 investments

Green Buildings

Key Drivers

- Real estate industry is primed to undergo transition
 - Increasing government focus on affordable housing (Housing for All mission), having granted it infrastructure status⁸⁹
 - Rising urban migration and economic growth driving demand for residential and commercial space
 - o Regulatory reforms: Goods and Services Tax (GST) and Real Estate Regulation Act (RERA)
- Large part of the housing stock is yet to be built with urban and rural housing shortage at 19 million⁹⁰ and 44 million⁹¹, respectively. Green buildings combine the prospect of sustainable development with resource efficiencies for India
- Early signals from significant growth in recent years. The registered green building space reached 6.3 billion sq ft, having more than trebled between 2014 and 2018 and further expected to touch 10 billion sq ft by 2022⁹²
- Subsidy available under Pradhan Mantri Awas Yojana (Urban), PMAY (U) scheme that can significantly bring down the interest component for a borrower

 $^{^{84}\} https://niti.gov.in/writereaddata/files/document_publication/RMI_India_Report_web.pdf$

⁸⁹ http://pib.nic.in/newsite/PrintRelease.aspx?relid=176165

 $^{^{\}rm 90}$ http://www.nbo.nic.in/Images/PDF/urban-housing-shortage.pdf

 $^{^{91}\,}http://planning commission.nic.in/aboutus/committee/wrkgrp12/rd/wgrep_iay.pdf$

⁹² https://igbc.in/igbc/html_pdfs/IGBC_Annual_Report_2017_2018.pdf

Challenges

- End-consumer demand challenges: Lack of public awareness around green buildings, limited preference for sustainable building materials (like perforated bricks or hollow blocks), higher (real or perceived) first costs (i.e., cost for construction) and low client demand are identified as the biggest barriers to green building activity in India⁹³
- Demand is higher from the commercial (office) space with the government focus on increasing energy efficiency in commercial spaces⁹⁴, whereas similar regulatory focus is lacking on the residential side where massive development is underway

Business characteristics and financing mechanisms

- Primarily funded through housing loans from banks and NBFCs
- Incremental capital investment in green buildings has come down also bringing down the payback period, and removing the argument of 'significant' additional costs being incurred to make a building green (incremental cost ranged between 15-18% in early 2000s that was less than 2% in 2015⁹⁵)
- To **promote green uptake from residential sector**, linking of mortgage costs to green ratings (lower cost for green rated homes) and allowing a raise in eligibility limit for borrowers seeking to finance green homes can help expand demand

Organic Farming

Key drivers

- Increasing health awareness Consumers are becoming aware of the food safety and environmental impact of tradition farming
- **Rising disposable income** Higher disposable income allows consumers to spend high-priced nutrient, safe, and environmentally friendly organic foods
- Change in food habits Indian consumers have started giving importance to nutrient content and quality of food which was earlier neglected
- Support from the Government Financial assistance and technical support from the Government is available under various schemes such as National Mission for Sustainable Agriculture (NMSA), Mission for Integrated Development of Horticulture (MIDH), and Rashtriya Krishi
- Availability of right technology Availability of software solutions, internet of things, and solar-powered electricity for storing organic foods in remote areas. Technology allows to gauge the quality of output and mitigate traceability challenge

Challenges

- Lengthy procedure and expensive certification cost Farmers need a verification agent to label the foods as organic. The procedure is lengthy since the verification must undertake due diligence measure before giving certificates. The cost of certification is also expensive for small and marginal farmers
- Lack of standardization of certificates Standards are not uniform across different certification agencies, which requires a farmer to get certificate from multiple agencies in case the farmer produce multiple organic products
- **High cost of farming in initial years** As land is not fit for organic farming, yield is low in the initial years, cost per unit of output increases in the initial years
- **Limited awareness among consumers** Consumers are not aware of benefits of organic farming as market promotion is limited. This is limiting the growth of organic food sales
- **High cost of organic food** High certification, labelling, training, and logistic (per unit basis) makes organic farming expensive than conventional farming

- **Premium Price of products** only targeting a niche consumer group aware of benefits of organic foods, having high disposable income, and willing to spend higher amount on healthy foods
- **Higher labour cost and lower yield during conversion years** High labour force required to make the land fit for organic farming and lower yield due to transition from conventional to organic farming
- **Higher operating expenses** Need of certification increases operating expenses and high organic input cost as conventional fertilizers is not used in organic farming
- Medium to long investment horizon (3 years transition period for certification and making land fit for organic farming)

⁹³ https://www.worldgbc.org/sites/default/files/World%20Green%20Building%20Trends%202018%20SMR%20FINAL%2010-11.pdf

⁹⁴ Energy Conservation Building Code (ECBC) sets minimum energy standards for new commercial buildings

⁹⁵https://igbc.in/igbc/html_pdfs/aboutGBC/CII%20IGBC%20Dossier%20on%205%20Billion%20sq.ft%20of%20green%20building%20footprint%20.pdf

- Medium- and long-term upfront capital for land conversion
- Higher working capital to cover higher operating expenses
- Banks and NABARD are the suitable low-cost medium and long-term debt and working capital financing

Agroforestry

Key drivers

- Rising demand of agroforestry products such as plywood, timber, and pulp
- Alternative source of income for farmers in addition to farming
- Government support for agroforestry since it increases farmer income, generates employment, and enhances the ecosystem under various policy initiatives such as Planning Commission Task Force on Greening India 2001, National Bamboo Mission 2002, and Green India Mission 2010

Challenges

- Restrictive regulation on harvesting and transporting of agroforestry products such as obtaining permits for harvesting and transportation from different government agencies
- Price volatility of agroforestry products such as wood, timber, and pulp prices
- Unorganized market (no price discovery mechanism) farmers don't get the due price since they don't have direct access to market
- Lack of good quality planting material such as improved seed varieties and clones
- Lack of institutional finance and insurance coverage

Business characteristics and financing mechanisms

- Medium to long investment horizon There is a long-time (5 to 25 years) gap between plantation and harvesting of agroforestry products
- High working capital requirement (mostly labour cost) between plantation and harvesting
- · Risk of high losses due to theft and natural calamities such as flood, drought, and storm
- Long term soft loans for growing trees and incurring labour cost to protect trees against risks such as theft
- Grants to conduct capacity development programs and subsidize high quality plants materials
- Subsidized insurance coverage against losses
- NABARD can offer long term soft loans to cover upfront and recurring cost
- Budgetary outlays To subsidize insurance cost and high-quality plan materials

Wastewater

Key drivers

- Shrinking fresh water sources and water scarcity
- Increasing demand from industries and commercial establishment
- Growing urbanization generates higher amount of waste water in cities with inadequate wastewater treatment plan
- Government policy and support under Swachha Bharat Mission and Smart City programme

Challenges

- Subsidized water price makes wastewater treatment plan commercial infeasible
- Poor financial health of urban authorities does not allow them to set up wastewater treatment plan
- **Poor contractual agreement between urban authorities and private developer** doesn't give confidence to financers to provide capital to set up wastewater projects

- Capital intensive business (for civil construction, plant, building, etc.)
- Substantial operating and maintenance cost
- Long investment horizon Around 15 years (break even period 3 to 8 yeas)
- **Economically unviable on pure commercial basis**; profitability depends on grants, customer base, and additional water availability
- Financing depends on type of business model: Privately owned model needs long term commercial capital for a longer period while government owned model needs working capital to undertake O&M activity
- Budgetary outlay to cover a portion of upfront cost as wastewater project is not commercially viable
- Banks can be directed to provide low cost debt capital to private sector

Municipal Solid Waste (MSW)

Key drivers

- MSW is a **major environmental problem** in metropolitan cities, for example, pollution from burning of solid waste. There are growing concerns over the impact of MSW on human health, environment, and socio-economic well-being
- Favourable support from the Government under various policy measures such as Swachh Bharat, Smart City program

Challenges

- · The poor financial health of urban authorities, which does not allow them to undertake this MSW projects
- Lack of financial feasibility Cash flow generation from the project is not enough to cover the financial cost
- Lack of capacity local authorities don't have adequate and skilled manpower for effective waste management
- Lower user charges As low as INR 20 to INR 100 per month per household

Business characteristics and financing mechanisms

- Capital intensive Need to develop transfer station, waste processing facility, and landfill which requires heavy upfront capital
- High operating cost Incurred on the collection, transportation, and cleaning of solid waste
- **Economically unviable on a pure commercial basis** as user charges are low and there is a limited avenue of generating additional income. This makes the project entirely dependent on public finances
- Long term and low-cost capital to set up the facility, and working capital to cover operating expenses
- Government can fund the project on annuity basis to make the project financially viable; low cost of capital can reduce the annuity cost of the project
- Government financing can cover a portion of upfront cost to reduce the riskiness of the project (developer of the project)
- Banks can provide low-cost debt capital, and the private sector can bring in required equity capital; the cost of debt and equity capital depends on the commercial viability of the project and contractual commitment of the government

Air Pollution

Key drivers

- Growing concerns over the impact of air pollution on health 140 million people breathing polluted air which is 10 times the WHO prescribed safe limit and 1.2 million deaths due to air pollution in India
- · Growing demands for air filter owing to rapid industrialization, the vehicular market in particular
- Increasing compliance standards, for example, Bharat stage standards for a commercial vehicle
- Economic losses 3% loss to the GDP due to air pollution especially health-related cost

Challenges

- Pollution norms are frequently violated since regulatory inspections of plants are not frequent
- Access to emissions records is generally restricted to the regulator, so there is limited public pressure on the government to come with stringent measures to control air pollution
- High compliance cost for the private sector The capital and operating cost of air pollution controlling equipment is high
- Inadequate policy measures The recently launched of new Programme (National Clean Air Programme, 2019) is lacking on multiple fronts:
 - o No clarity on funding provision a paltry INR 300crore has been allocated
 - o No assessment was done on the financial needs of the mitigation action plan
 - Lack of clarity on resources required to air pollution mitigation actions.
 - o No suitable mechanism to finance the projects or technologies for combating air pollution

- Manufacturing of air pollution controlling equipment is capital intensive
- The **long investment horizon for the manufacturer**, project developer (electric bus, waste to energy and solid waste management projects for example), and user (Industrial buyers)
- Not a cash flow generating business for industrial and commercial users but a compliance cost
- The need for public funding for, for example:
 - o Subsidizing electric bus to make it commercially viable
 - o Purchasing of dust-pressing equipment
 - Monetary benefits to farmers not to burn crops
 - o Purchasing air control monitoring equipment

- Mass purchase of certain air pollution control equipment when a large section of society is not able to purchase
- o Concessional capital to undertake R&D to invent cost-effective air pollution control equipment
- o Subsidized loans to industrial sectors to buy air-pollution controlling equipment

Climate adaptation

Key drivers

- The high density of economic activity and population in India
- India, being a tropical country, crop yield is vulnerable to warming
- **High dependence on monsoon for agriculture** Climate change affects the rain pattern and consequently adversely affecting agriculture
- Being the 2nd largest populous country and home to 2/3rd of the world's poor, social and economic cost due to climate change is high

Challenges

- Historically, climate adaptation is the mandate of the Government as climate adaptation is a public good
- **Poor policy and the institutional environment** Concerns over contractual enforcement and the rule of law discourage private investment on climate adaptation
- Uncertain value proposition Lack of certainty on benefits of investing in climate adaptation as there is no historical record
- **High upfront cost** Most of the climate adaptation projects are capital intensive

- Long investment horizon Benefits of climate adaptation project yield benefit over a long time
- Long-term debt at a lower rate for capital-intensive projects to make it economically viable
- Risky and growth capital for products/services with adaptation benefits; for example, investment in disaster warning systems, hygienic products, and developing climate adaptation drugs
- Concessional capital for a commercially infeasible project such as rural water supply, sanitation

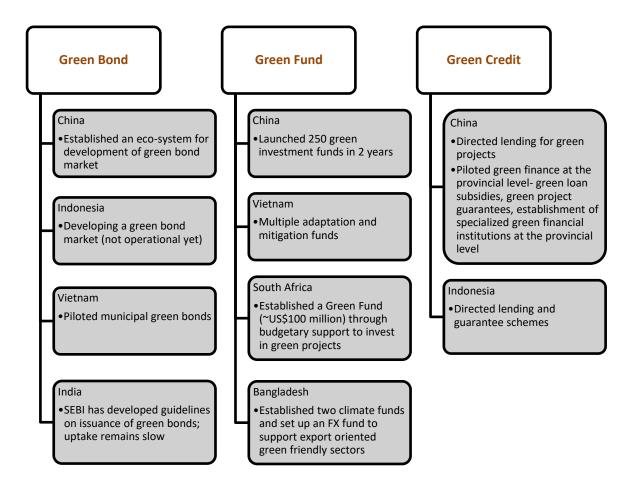

ACCELERATING TRANSFORMATIVE ACTION

6. Green Finance: Actions to Accelerate Transformation

Having defined green finance with respect to application, usage, and sectors, it is equally important to reflect on the approaches to enhance capital flows for green investments. An overview of some key international policy and regulatory interventions⁹⁶ to catalyze green financing are presented below.

Figure 17: International perspectives on policy interventions in green finance

_

 $^{^{\}rm 96}$ High level summary of the same is provided in Annexure 4

Figure 18: International perspectives on regulatory interventions in green finance

Incorporation in risk Green as a priority Other regulatory **Disclosure practices** Low risk weightage Sector management interventions China China China Indonesia **Environmental Liability** • Implementation in • Low-cost green Banks incentivised in Incorporates relending facility for phases: mandatory for the form of higher MPA environmental and • China: Corporate needs major polluters (2017); green projects scores* for higher social protection in to set up funds to mitigate future semi-mandatory proportion of green financial services (2018); mandatory for environmental liability loans and green bonds institutions' risk Indonesia all (2020) management Provision of green framework Indonesia Green banks (potential lending model for South Africa Banks incentivised to investment institution) priority sectors with a Bangladesh Mandatory exchange focus on national lend to • Environmental & Social • China: Creation of an listing requirement for energy security plan environmentally **Ecological** companies to disclose Risk Management friendly projects by (ESRM) guidelines for sustainable Development Bank and lowering risk Bangladesh local green banks performance financial institutions weightage Mandatory 5% (of total loans) credit quota for Bangladesh Bangladesh Vietnam Green ratings (potential directed green lending. enhancements to Banks required to Sustainability ratings Green credit guidelines Low-interest rate financial infrastructure) publish independent directly impact the encourage all credit refinance scheme for green annual reports, CAMELS rating of each institutions to • China: Establish a green projects in accordance with green rating system to bank. Opportunities and actions to enable green finance uptake within the financial sector participants

Implications and potential actions on the Indian front

Given the carbon emitting and polluting nature of certain activities wherein fully internalizing negative externalities is difficult, there is a need to correct this market failure by designing financial mechanisms to reward green investment. The financial mechanism could be created through blended financing (blending public capital with private capital to comfort private investors), providing better terms of credit (e.g. credit quota, subsidized interest rate, credit enhancement), and regulatory support (e.g. lower risk weightage to green lending, minimum investment in green sector).

^{*} Macro Prudential Assessment (MPA) system introduced by China's Central Bank in 2016 to assess banks' capital adequacy ratios, assets and liabilities, liquidity, and risk

Based on a bottom-up analysis of the impact of a green finance taxonomy on the investment and lending environment and mapping of sector-level investment requirements (in line with the NDCs) through 2030, this study presents some prospective interventions that can help evolve a transformative green finance environment in the country.

Figure 19: Policy and regulatory interventions to catalyze green finance at scale

Policy action

Macro approaches to increase green finance availability and allocation in the economy.

Earmarking a portion of Statutory Liquidity Reserves (SLR) from commercial banks for green investments through issuance of green government securities — Green SLR

Creating a dedicated green financial institution /bank which develops capacity and knowledge to access green and climate finance sources

Using a small part of Forex reserves to leverage and crowd in additional climate finance flows from international institutional investors by creating financial vehicles outside India

Regulatory action

Risk assessment guidance and disclosure mandates to enable reforms

RBI: Stronger risk assessment frameworks that recognize and measure green and non-green exposures of banks (green tagging), credit quota (under priority sector lending), green lending as a collateral for refinancing from RBI

Pension and Insurance Funds:

Minimum capital allocation to green projects, making climate change risk assessment of portfolio a fiduciary responsibility

SEBI: Mandatory disclosure of carbon emission and risk disclosure of listed companies, promotion of green equities and bonds, adjusting green premium to valuation of companies in the IPO stage

Market action

Markets need to be more responsive to institutional needs, esp. from international investors

Stock exchange: Promote listing of green equities and green bonds through incentives (lower listing fee), creation of dedicated green indices, lower brokerage fee for green investors

Mutual funds: Issue risk guidance materials for investors (especially retail investors) that highlight climate exposure risks, work with regulator to explore climate risk grading of funds

Credit rating agencies: Mandatory incorporation of climate change risks into rating models, realign credit ratings approach to promote green ratings

India needs to undertake strong steps to guide its economic growth in the coming decades. The financial sector, with its power and ability to direct capital flows, is central to this shift. As global political pressures increasingly hold all nations accountable to protecting the natural habitat, a transition is being observed in how growth is viewed through the lens of environmental objectives. As covered in this study, many developing and developed nations are making significant strides in setting brave targets, holding their policy and financial institutions accountable to making progress beyond 2030 goals by aiming at targets such as carbon neutrality for 2050. While creating a green finance taxonomy is only a first step to this longer-term endeavor, it is a significant one that can ensure "growth" and "green" are emphasized in parallel to foster in a modern era of "green growth".

ANNEXURES

Annexure 1: List of Stakeholders Engaged

The table below highlights some of the key stakeholders: public and private banks, NBFCs, regulatory bodies, and institutional investors that were engaged for consultation.

Contact Name	Designation	Name of the organization
Amarendra Mohan	Senior Program Director	Centre for Advanced Financial Research
		and Learning (CAFRAL)
Anand Bhoumik	Managing Director and Chief Analytical Officer	India Ratings
Anita Marangoly	Executive Vice-President Growth Markets	CDPQ India
George		
Aparajit Pandey	Programme Director (Climate, Energy and	Observer Research Foundation (ORF)
	Resources)	
Arun Srinivasan	EVP & Head – Fixed Income	ICICI Prudential
Dinesh Pruthi	Deputy General Manager (Sustainability)	State Bank of India
Elodie Feller	Investment Programme Lead	UNEP Finance Initiative
Frédéric Asseline	Principal Climate Change Specialist	Asian Development Bank (ADB)
Jaisingh Dhumal	Chief Manager & Head, Technology Finance	ICICI Bank
	Group	
K.P. Baiju	Deputy General Manager	State Bank of India
Kristina Alnes	Senior Advisor	Center for International Climate Research
		(CICERO)
Lakshmi Iyer	Chief Investment Officer (Debt)	Kotak Mahindra Asset Management Co.
		Ltd.
Mona Kachhwaha	Director Investments	Caspian
Pawan Singh	MD & CEO	PTC India Financial Services
Pravin Kutumbe	Member (Finance and Investment)	Insurance Regulatory and Development
		Authority of India (IRDAI)
R R Rashmi	Distinguished Fellow, Earth Science and	TERI
	Climate Change	
Rajasree Ray	Economic Adviser, Deptt of Economic Affairs	Ministry of Finance
Rajeev Kumar Gupta	Deputy General Manager	India Infrastructure Finance Company
		Limited (IIFCL)
Rajesh Kumar Miglani	Senior Climate Business Specialist	International Finance Corporation (IFC)
Rajnish Kadambar	Senior Environment Risk Specialist	IDFC Bank
Reema Sen	Managing Partner	RSSG BFSI Advisory
Satish Mandhana	Managing Director & Head of Investments	EverSource Capital
Satyajit Suri	Chief Operating Officer	Raintree Ventures
Shamik Roy	SVP & Head DCM	ICICI Securities
Shankar Pande	Chief General Manager	National Bank for Agriculture and Rural
	j	Development (NABARD)
Sudipto Basu	Deputy General Manager, Project Finance	ICICI Bank
Supratim	Member (Finance)	Pension Fund Regulatory and
Bandyopadhyay		Development Authority (PFRDA)
Vidya Iyer	AVP & Fund Manager - Fixed Income	ICICI Prudential
Vishal Ambani	Senior Vice President, Project and Structured	Mizuho Bank
-	Finance	

Annexure 2: Expert Committee

Name	Designation	Name of the organization
A. Damodaran	Professor, Economics & Social Sciences	IIM Bangalore
Amarendra Mohan	Senior Program Director	CAFRAL
Atul Bagai	Head	UN Environment Country Office, India
Rathin Roy	Director	National Institute of Public Finance & Policy
Runa Sarkar	Dean (Academic)	IIM Calcutta
Sharmila Chavaly	Principal Financial Advisor	Northern Railway

Annexure 3: Country Selection Framework

The country validation framework maps key parameters relating to exposure to climate externalities (risks) and future potential to respond to climate risks (financial resources), and compares these to India to identify a peer set that shares similar challenges and opportunities. Human Development Index⁹⁷ (rank): Countries with low levels of human development (higher ranking) generally have low emissions but are often the most vulnerable to climate risks. We use the following set of indicators to compare the peer set.

- Vulnerability to Climate change⁹⁸ (rank): Intergovernmental Panel on Climate Change (IPCC) defines Vulnerability as "the degree to which a system is susceptible to, and unable to cope with, adverse effects of climate change, including climate variability and extremes. Vulnerability is a function of the character, magnitude, and rate of climate change and variation to which a system is exposed, its sensitivity, and its adaptive capacity". A lower score denotes higher vulnerability.
- GDP per capita⁹⁹, current prices in PPP in US\$) 2017E: Higher per capita denotes better capacity to absorb transition costs towards a low carbon economy.
- 5-year average GDP growth % (2019E-23E): Higher growth rates, if unmanaged, may create greater strain on economic resources.
- % share in global CO₂ & GHG emissions¹⁰⁰ (kton CO₂), 2016: Indicator defines the existing state of vulnerability in climate-associated risks. Countries with higher emissions would require a very urgent and rapid action towards reducing their greenhouse gas emissions.
- CO₂ & GHG emissions per economic output¹⁰¹ (kg per PPP \$ of GDP): Reducing CO₂ emissions per unit of GDP (known as carbon intensity) is a key metric in the intended nationally determined contribution (INDC) promised by many countries. India has promised to reduce the emission intensity by 33-35% from 2005 levels by the year 2030.

Each indicator is aligned to a uniform scale of 1 to 5 (with 1 being the lowest score). Each indicator is allocated a specific score based on this rating scale. Individual scores (under each indicator) are then weighted and summed up to arrive at a final weighted score for each country. The assignment of weights is dependent on relative importance of the indicator in prompting a climate action from a country.

Scoring metric	HDI (Rank) score	Vulnerability to Climate change (Rank) score	GDP per capita score	% GDP growth score	Share in global CO ₂ & GHG emissions score	CO ₂ & GHG per \$ GDP score
	>150 = 5	Rank 1-10 = 5	>50K= 5	>6% = 5	>10% = 5	>0.4 = 5
	100-150 = 4	Rank 11-20 = 4	25-50K = 4	4-6% = 4	2-10% = 4	0.3-0.4 = 4
	60-100 = 3	Rank 21-35 = 3	15-25K = 3	2-4% = 3	1%-2% = 3	0.2-0.3 = 3
	20-60 = 2	Rank 36-50 = 2	5-15K = 2	0-2% = 2	0.5%-1% = 2	0.1-0.2 = 2
	<20 = 1	Rank over 50 = 1	<5K = 1	Less than 0% (negative growth) = 1	less than 0.5% = 1	less than 0.1 = 1
WEIGHTS	20%	20%	10%	20%	10%	20%

⁹⁷ HDI is a composite statistic of life expectancy, education, and income per capita indicators. A country scores higher HDI when the life expectancy at birth is longer, the education period is longer, and the income per capita is higher.

⁹⁸ According to HSBC Global Research report: Fragile Planet.

⁹⁹ IMF World Economic Outlook, 2018

¹⁰⁰ Fossil CO₂ & GHG emissions of all world countries, 2017: EDGAR (Emissions Database for Global Atmospheric Research)

¹⁰¹ Calculates the amount of CO₂ & GHG emissions (expected to be) released to produce every additional dollar of GDP

Country Comparables for India

Country	Human Development Index (Rank)	HDI Score	Vulnerability to Climate change (Rank)	Vulnerability to Climate change (Rank) Score	GDP per capita, current prices in PPP in US\$, 2017E	GDP per capita Score	5-year average GDP growth% (2019E-23E)	% GDP growth Score	% share of CO ₂ & GHG emissions globally, 2016	Share of global emissions Score	CO ₂ & GHG emissions per economic output (kg per PPP \$ of GDP)	Emissions per \$ GDP Score	WEIGHTED SCORE

Annexure 4: Mapping the International Experiences

	Bangladesh	Vietnam	China	Indonesia	South Africa	EU
Country Drivers/Challenges	Climate change vulnerabilities: Countries like Bangladesh¹0², India, Pakistan and Sri Lanka at high risk. Low-lying Bangladesh faces higher risk of flooding, cyclones, having severe hotspots¹0³. Most of the population (163mn) located in severe (16%) and moderate (66%) hotspots NDC¹0⁴: ↓5% (unconditional), up to ↓15% (conditional) emissions intensity from Business as Usual (BAU) levels by 2030 in power, transport, and industry sectors	 Continued reliance on natural resources and the competing target to reduce strain on land use and biodiversity in a growing economy NDC: ↓8% (unconditional), up to ↓25% (conditional) in GHG emissions by 2030 from BAU. Includes 20% ↓ target for emissions intensity (per unit GDP) and 45% ↑ on forest cover. NDC covers Energy, Agriculture, Land Use, Land Use Change and Forestry (LULUCF) and Waste 	 Population Size, staggering economic growth, rapid industrialization and urbanization have strained natural ecosystems. Country heavily relies on coal (62% of energy mix in 2016). Environmental hazards from air, water and soil pollution pose significant risk NDC: reduce CO₂ emissions per unit of GDP by 60% to 65% from the 2005 level. Focus on energy, iron & steel, chemical, and transportation 	 Extensive tropical rainforests with high biodiversity at risk Extreme vulnerability to natural disasters (with increased frequency being a direct consequence of climate change) NDC: ↓29% (unconditional) up to ↓41% (conditional) in GHG emission by 2030 from BAU. NDC focus on Land and forest restoration and increasing renewable energy mix 	 Developmental economy with poverty elimination and eradication of inequality identified as two key priorities. Climate policy action towards low carbon transition facing these overriding priorities Acute energy challenges from coal reliance (90% share in energy mix) NDC: Reduction in emissions (unconditional) by -26% to +12% by 2030 from 2010 level excl. LULUCF (Land use, land-use change, and forestry)¹⁰⁵ 	EU 2030 climate and energy targets: ↓40% in GHG emissions compared to 1990 levels, share of renewable energy ↑27%, energy savings target of 27% compared to BAU EU requires additional EUR 180billion annually to meet 2030 climate and energy targets (EIB estimates) Filling the investment gap requires increased private sector participation
Goals & Investment Potential ¹⁰⁶	Protect environmental degradation Ensure sustainable banking practices to promote resource efficiency and low carbon industries Climate-smart investment potential by 2016-30 (IFC): US\$ 138billion Green buildings: US\$ 113billion Transport infrastructure: US\$ 5billion Renewable energy: US\$ 17billion	 Greening the sectors and promoting resource efficiency Improve living standards and create environmentally friendly lifestyle Climate-smart investment potential by 2016-30 (IFC): US\$ 753billion Transport infrastructure: US\$ 571billion Renewable energy (solar, hydro): US\$ 59billion Green buildings: US\$ 80billion 	 Environmental pollution control Protecting the environment by changing China's structure of the economy and conserving energy and resources Climate-smart investment potential by 2016-30 (IFC): US\$ 14.9trillion Transport infrastructure: US\$ 725billion Renewable energy (solar, hydro): US\$ 773billion Green buildings: US\$ 12.9trillion 	Making the financial sector resilient, competitive and sustainable Driving finances into sustainable businesses - environmentally friendly, economic growth and employment generating, and inclusive Climate-smart investment potential by 2016-30 (IFC): US\$ 274billion Transport infrastructure: US\$ 20billion Renewable energy (solar, hydro): US\$ 23billion Green buildings: US\$ 209billion	 Increase share of renewable mix in energy mix Efficient usage of natural resources, particularly water Preserving biodiversity and ecosystem Pollution control Climate-smart investment potential by 2016-30 (IFC): US\$ 588billion 	 Mobilize private capital towards green and sustainable investments Provide thrust for further action in areas such as labels, disclosure, standards and changes to prudential rules As per EIB, EU would need an additional funding of EUR 270billion (US\$ 307billion) annually to meet the sustainable development goals related to the energy, transport, water and the waste sector

¹⁰² South Asia's Hotspots. The Impact of Temperature and Precipitation Changes on Living Standards

¹⁰³ The report defines a hotspot as a location where changes in average weather will have a negative effect on living standards.

¹⁰⁴ An "unconditional contribution" is what countries could implement without any conditions and based on their own resources and capabilities. A "conditional contribution" is one that countries would undertake if international means of support are provided, or other conditions are met. Source: Pocket Guide To NDCs under the UNFCCC

	Bangladesh	Vietnam	China	Indonesia	South Africa	EU
Approach	Green guidelines aligned to overall Climate Change Strategy and Action Plan. The central bank that issued Green Banking Guidelines is the primary enabler for driving green banking Soft start with issuance of CSR guidelines (voluntary) and RE refinance schemes later built on with Green Banking policy and Environmental & Social Risk Management (mandatory) in credit risk assessment by Banks and FIs	Established National Green Growth Strategy (2011-20) in 2009 to facilitate low carbon transition (8-10% lower emissions), greening production (efficient use of natural resources, green agriculture, green industry, pollution prevention), greening lifestyles (wastewater, urban transportation and green urban standards) Green banking to play a key role. Central bank issued Catalogue to define green sectors Capital markets regulator driving company sustainability reporting	 Green finance integrated with other economic policies Set up Green Finance Taskforce by People's Bank of China (PBOC); "Establishing a Green Financial System" made an official mandate from Central Party Committee and State Council Green finance definition with multiple levels- defines sectors, sub-sectors and project activity covering eligible projects with guidelines and description Green finance defined in two dimensions: Green Bond and Green Credit Guidelines 	Economic development plan integrated with sustainable development framework. Green finance aspect comes under "Indonesian Roadmap for Sustainable Finance 2015-2019" by Financial Services Authority Green finance definition covers climate change mitigation, resource efficiency, protection and natural capital and biodiversity, as well as climate change adaption Policy on green bond issuance to invite participation from private players as also provide clear guidance	Initial steps undertaken but as yet no broader green finance definition Stock Exchange adopted Green Bond Principles (GBP) from International Capital Market Association (ICMA) as guidelines for green bond listings. Green defined at 2 levels: sectors and activities Green project categories under GBP include: climate change adaptation, climate changes mitigation, natural resource conservation, biodiversity conservation, and pollution prevention and control	Sustainable taxonomy proposed in 2018, planned rollout in 2020-22. Plan to embed sustainability taxonomy in EU law Taxonomy focuses on defining environmentally sustainable activities; future iterations may include social Sectoral approach: mitigation, adaptation, water protection, waste recycling, pollution and healthy ecosystems Develop labelling standards for financial products called EU Ecolabel and prospectus for green bonds in 2019
Unique levers	Green credit (directed lending and refinance schemes) Sector-specific guidelines and checklists E&S risk management Introduced as voluntary guidelines that later took shape as mandatory reporting	 Sector-specific guidelines and checklists Incorporation in risk management Granular green selection guidelines Standardized reporting 	 Green credit (directed lending and refinance schemes) Granular green guidelines Green Finance Pilot programs in provinces to encourage local banks to place greater emphasis on green lending Standardized reporting 	 Low risk weightage to green Incorporation in risk management 	Climate change risk management in investment decision making of pension funds	 Provide standards, and sustainability benchmarks (EU Ecolabel) Standardized reporting (to be implemented)
Performance* & Tracking	~US\$ 6.56billion disbursed in green finance (FY17); 77.7% from private commercial banks. Green credit 7.1% of total FY17 credit ¹⁰⁷ Near 100% compliance by banks and FIs in setting own Green Banking Policy Guidelines Bank reporting on green lending, carbon footprint and environment-related CSR activity flow into CAMELS rating ¹⁰⁸ formance numbers unavailable, where is the green formance numbers unavailable.	 ~US\$ 4.7million as of June 2017 disbursed towards green finance. 1.7% of total outstanding credit provided for green finance in 2017¹⁰⁹ Quarterly reporting by banks on E&S risk management and green finance flows to central bank 	 US\$ 1.37trillion (10% of all loans) in green credit (2019)¹¹⁰. Green credit >95% of green financing¹¹¹ USD 289bn of green bonds outstanding (2018)¹¹² Better asset quality: Nonperforming loans (NPL) for green credit at 0.37% vs. 0.87% average NPL of major banks¹¹³ 	 Country issued its first sovereign green bond of US\$ 1.25billion in 2018 Banks required to develop sustainable financing action plans and report green financing 	Listed companies have to integrate sustainability reporting with financial reporting (or provide reason for non- compliance)	Disclosures to be aligned based on specifications by the Commission

^{*}Performance numbers unavailable where green policy, definition was implemented recently or it is yet to be implemented

¹⁰⁷ BDT 548.6billion of green credit vs. BDT 7,723.40billion of outstanding bank credit in FY17

¹⁰⁸ CAMELS is a supervisory rating system used to classify a bank's overall condition
